Outline

- LHC, Tevatron & Detectors
- Higgs Observation in Boson and Fermion decay
- Higgs Combination
- Higgs Measurements – Mass, Coupling, Spin/Parity Width, Cross-section
- Summary - LHC, Tevatron

The LHC

Overall data taking efficiency $\sim 90\%$ by both detectors
 Mean pileup 21 interactions/bunch crossing recorded
 A major challenge overcome by both ATLAS and CMS

CMS Integrated Luminosity, pp

The Tevatron

The Tevatron accelerator

Beam tunnel of Tevatron ring

Proton-Antiproton collider Tevatron Run II: (2002-2011), $\sqrt{s} = 1.96$ TeV
A decade of successful running delivered ~ 10 fb⁻¹ of luminosity for physics to CDF and DØ, shut down September 2011

Detector subsystems

Vertex Detector
Silicon Tracker

Electromagnetic Calorimeter
Hadronic Calorimeter

Muon System

DØ & CDF detector

SM Higgs Sector @ LHC

Great achievement to four decade long quest
A Higgs-like state pinned down at 125 GeV

Higgs (125)

Higgs Boson @ LHC & Tevatron

arXiv:1407.0558 [hep-ex]

- The signal @125 GeV with significance $> 5\sigma$ observed in $\gamma\gamma$ decay mode
- 6.7σ significance @125 GeV observed in $H \rightarrow ZZ^* \rightarrow 4l$ golden decay mode

$$H \rightarrow \gamma\gamma$$

$$H \rightarrow ZZ^* \rightarrow 2e2\mu$$

Observation of Higgs Boson in $\gamma\gamma$ and $ZZ^* \rightarrow 4\ell$ decay channels at ATLAS

arXiv:1408.7084 [hep-ex]

arXiv:1408.5191 [hep-ex]

- $H \rightarrow ZZ^* \rightarrow 4\ell$ signal observed with a significance of 8.1σ at $m_H = 125.36 \text{ GeV}$
- Measured signal strength $\mu = 1.44^{+0.40}_{-0.33}$ in $ZZ^* \rightarrow 4\ell$ and 1.17 ± 0.27 in $\gamma\gamma$ mode

$$H \rightarrow \gamma\gamma$$

 **ATLAS**
EXPERIMENT

Run Number: 204769, Event Number: 24947130

Date: 2012-06-10 08:17:12 UTC

$$H \rightarrow ZZ^* \rightarrow 4\mu$$

Run Number: 204769
Event Number: 82599793
Date: 2012-06-10, 13:12:52 CET

EtCut > 0.4 GeV
PtCut > 1.0 GeV

Muon: blue
Cells: Tiles, EMC

Phys. Rev. Lett. 109, 071804 (2012)

Combined searches for $WH \rightarrow l\nu b\bar{b}$, $ZH \rightarrow ll b\bar{b}$, and $WH+ZH \rightarrow \text{MET} b\bar{b}$ using full 9.7 fb^{-1} Tevatron dataset

Excess of data over the background seen with most significance in the mass range $120 \leq m_H \leq 135 \text{ GeV}$

Evidence of Higgs: Direct Indication of Higgs coupling to Fermions

2.8 σ significance at $m_H = 125 \text{ GeV}$

Higgs - Lepton Coupling @ ATLAS

ATLAS-CONF-2013-108

Evidence for Higgs - Lepton Coupling

- Excess $> 4\sigma$ observed over m_H 110 - 130 GeV
- Best fit signal strength $1.4^{+0.5}_{-0.4}$ for $m_H=125$ GeV
- Observed Significance 4.1σ for $m_H=125$ GeV
- A clear indication of Higgs - Lepton coupling

ATLAS Prelim.
 $m_H = 125 \text{ GeV}$

$H \rightarrow \tau\tau$

Run: 214021
Event: 269834309

2012-11-05 09:48:46 UTC

ATLAS
EXPERIMENT

Higgs - Lepton Coupling @ CMS

Evidence for Higgs - Lepton Coupling

JHEP 05 (2014) 104

Excess $>3\sigma$ observed over m_H 110 - 130 GeV

H $\rightarrow \tau\tau$ best fit signal strength 0.78 ± 0.27 for $m_H = 125$ GeV

Observed (expected) Significance 3.2σ (3.7σ) for $m_H = 125$ GeV

Strong affirmation on Higgs-Fermion coupling, a clear indication of Higgs-Lepton coupling

Signal strength μ compared to SM

$\mu = 0.78 \pm 0.27$

$H \rightarrow \tau\tau$

CMS Experiment at the LHC, CERN

Data recorded: 2012-Jun-05 09:58:43.400262 GMT(11:58:43 CEST)

Run / Event: 195552 / 61758463

Nature Physics 10, 557 (2014)

| Channel ($m_H = 125 \text{ GeV}$) | Significance (σ) | | Best-fit μ |
|----------------------------------------|---------------------------|----------|-------------------|
| | Expected | Observed | |
| $VH \rightarrow b\bar{b}$ | 2.3 | 2.1 | 1.0 ± 0.5 |
| $H \rightarrow \tau\tau$ | 3.7 | 3.2 | 0.78 ± 0.27 |
| Combined | 4.4 | 3.8 | 0.83 ± 0.24 |

Strong evidence for the **direct coupling** of the **125 GeV Higgs boson** to **fermions**, with an **observed (expected) significance of 3.8σ (4.4σ)**

- **ttH** important to probe directly top-Higgs Yukawa coupling
- Interested in ttH, H to anything with large enough BR
H→bb is the most attractive here for SM $m_H = 125$ GeV
- Categories events based on number of jets and b-tagged jets

arXiv:1408.1682 [hep-ex]

ATLAS-CONF-2014-043

Higgs Combination

CMS-PAS-HIG-14-009

$$\sigma/\sigma_{\text{SM}} = 1.00 \pm 0.13 \left[\pm 0.09(\text{stat.})_{-0.07}^{+0.08}(\text{theo.}) \pm 0.07(\text{syst.}) \right]$$

Higgs Combination @ ATLAS

ATLAS Prelim.

$m_H = 125.5$ GeV

$\sigma(\text{stat.})$
 $\sigma(\text{sys inc.})$
 $\sigma(\text{theory})$

Total uncertainty $\pm 1\sigma$ on μ

$\sqrt{s} = 7$ TeV $\int \text{Ldt} = 4.6\text{-}4.8 \text{ fb}^{-1}$
 $\sqrt{s} = 8$ TeV $\int \text{Ldt} = 20.3 \text{ fb}^{-1}$

Signal strength (μ)

ATLAS-CONF-2014-009

$\mu = 1.30 \pm 0.12$ (stat) $^{+0.14}_{-0.11}$ (sys) @ $m_H = 125.5$ GeV

Observation in good agreement with the Standard Model Higgs boson hypothesis

Higgs Combination @ Tevatron

Phys. Rev. D 88, 052014 (2013)

arXiv:1203.3774 [hep-ex]

- Combined searches by CDF and DØ for the SM Higgs boson in the mass range 100–200 GeV for bb , $\tau\tau$, $\gamma\gamma$, ZZ and WW modes
- A significant excess of events observed in the mass range between 115 and 140 GeV with local significance at $m_H = 125 \text{ GeV}$ corresponding to 3.0σ

Higgs Mass

H → $\gamma\gamma$ and H → ZZ* → 4l invariant mass distribution at CMS

High Resolution Mass Spectrum @ ATLAS

$H \rightarrow \gamma\gamma$ and $H \rightarrow ZZ^* \rightarrow 4l$
 invariant mass at ATLAS

Higgs Mass

$H \rightarrow \gamma\gamma$ and $H \rightarrow ZZ^* \rightarrow 4l$ combined mass measurement

$m_H(\text{ATLAS}) = 125.36 \pm 0.37 \text{ (stat)} \pm 0.18 \text{ (syst)}$

$m_H(\text{CMS}) = 125.03^{+0.26}_{-0.27} \text{ (stat)}^{+0.13}_{-0.15} \text{ (syst)}$

Higgs Coupling

CMS-PAS-HIG-14-009

2D likelihood scan for κ_g and κ_γ parameters assuming that $\Gamma_{BSM}=0$

Results within 1σ of Standard Model prediction

Mass & Coupling with $H \rightarrow \tau\tau$

Scan of $-2\Delta\ln L$, as function of m_H

background-only hypothesis includes the $pp \rightarrow H(125 \text{ GeV}) \rightarrow WW$ process

$M_H = 122 \pm 7 \text{ GeV}$

Likelihood scan as a function of κ_V and κ_f
All nuisance parm. profiled for each point

$pp \rightarrow H(125 \text{ GeV}) \rightarrow WW$ process added as a signal for vector boson coupling sensitivity

Higgs Coupling @ ATLAS

ATLAS-CONF-2014-009

ATLAS Preliminary

$m_H = 125.5 \text{ GeV}$

Total uncertainty

$\pm 1\sigma$ on $\frac{\mu_{\text{VBF+VH}}}{\mu_{\text{ggF+ttH}}}$

Phys. Rev. D 88, 052014 (2013)

2D constraints in (κ_W, κ_Z) plane for $m_H=125 \text{ GeV}$ allowing κ_f to float

The points that maximize the local posterior probability densities are marked with dots

2D constraints in the (κ_V, κ_f) plane assuming Custodial symmetry ($\lambda_{WZ}=1$)

Higgs Spin / Parity

Matrix Element Likelihood Analysis

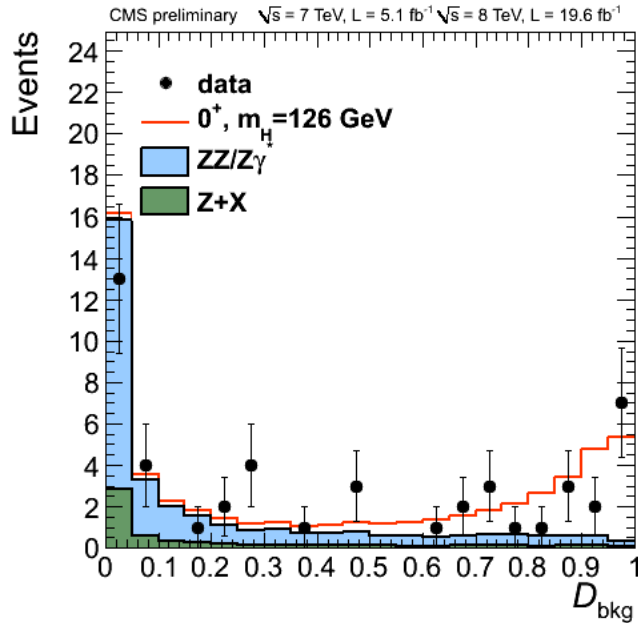

$$\text{MELA} = \left[1 + \frac{\mathcal{P}_{\text{bkg}}(m_1, m_2, \theta_1, \theta_2, \Phi, \theta^*, \Phi_1 | m_{4\ell})}{\mathcal{P}_{\text{sig}}(m_1, m_2, \theta_1, \theta_2, \Phi, \theta^*, \Phi_1 | m_{4\ell})} \right]^{-1}$$

Masses of dilepton pairs and five angles fully defining a four-lepton configuration in their centre-of-mass frame

Higgs Spin & Parity @ CMS

Discriminant for production and decay of different Higgs J^P state

$$D_{J^P} = \frac{\mathcal{P}_{SM}}{\mathcal{P}_{SM} + \mathcal{P}_{J^P}} = \left[1 + \frac{\mathcal{P}_{J^P}(m_{Z_1}, m_{Z_2}, \vec{\Omega} | m_{4\ell})}{\mathcal{P}_{SM}(m_{Z_1}, m_{Z_2}, \vec{\Omega} | m_{4\ell})} \right]^{-1}$$

Statistically equivalent to the 2D analysis of $m_{4\ell}$ and K_D

$$D_{bkg} = \mathcal{P}_{sig} / (\mathcal{P}_{sig} + \mathcal{P}_{bkg})$$

Hypotheses of a **pseudoscalar** and all tested spin-1 boson hypotheses excluded at 99% CL or higher

Consistency with SM scalar boson

CMS-PAS-HIG-14-014

- Using full angular information defining 4 lepton system
- For each hypothesis create kinematic discriminant for SM vs alternative hypothesis
- Perform 2D fit of hypothesis discriminant versus background discriminant and perform hypothesis test

Several J^P hypotheses have been tested
 Consistency with the SM scalar boson

Higgs Spin & Parity @ ATLAS

Phys. Lett. B 726, 120 (2013)

Hypotheses of a **pseudoscalar** state as well as spin-1 and spin-2 hypotheses disfavoured over a SM scalar boson

Higgs Width

Off-shell Higgs production sizeable at high ZZ mass

- ~7.6% of the total cross-section for $m_{ZZ} > 2M_Z$
- Destructive interference between $gg \rightarrow H \rightarrow ZZ$ and $gg \rightarrow ZZ$

Ratio of **on-shell** and **off-shell** production cross-section gives a direct handle to constrain the total width (taking into account interference)

Proposed by
 F. Caola, K. Melnikov, PRD 88 (2013) 054024
 N. Kauer, G. Passarino, JHEP 08 (2012) 116
 J. Campbell et al. (arXiv:1311.3589)

On shell and off shell production in ZZ:

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{on-shell}} \sim \frac{g_{ggH}^2 g_{HZZ}^2}{m_H \Gamma_H}$$

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{off-shell}} \sim \frac{g_{ggH}^2 g_{HZZ}^2}{(2m_Z)^2}$$

On-shell and off-shell cross-section expressed as a function of signal strength by scaling the couplings

- **On-shell**

cross section constrained by $H \rightarrow ZZ \rightarrow 4l$ search
 $\mu = \sigma / \sigma_{SM} = 0.93^{+0.26}_{-0.24}$ (Expectation of $1.0^{+0.27}_{-0.24}$)

- **Off-shell**

cross section is constrained by $H \rightarrow ZZ \rightarrow 4l$ and $H \rightarrow ZZ \rightarrow 2l2\nu$ final states

4l final state

Using the baseline $H \rightarrow ZZ$ selection strategy

- Exploiting full reconstructed final state to separate $gg \rightarrow ZZ$ from $qq \rightarrow ZZ$ at high mass
- Using angular discriminant as in the 4l baseline search
- Signal extracted by 2D fit in the mass and kinematic discriminant

2l2v final state

Requiring a di-lepton and high missing E_T

- Mass shape fit in different jet categories

- **Observed limit of $5.4 \times \text{SM}$ corresponding to $\sim 22 \text{ MeV}$ @ 95% CL**
- **Sensitivity exceeds all expectations enhancing the LHC role of a Higgs factory in next years**

Physics Letters B 736, 64 (2014)

Higgs Width @ ATLAS

- Analysis in the 4l channel uses a likelihood fit to the distribution of a matrix element discriminant
- Analysis in the 2l2v channel counts events in a $H^* \rightarrow ZZ$ enriched signal region with high E_T and high transverse mass
- Separate $gg \rightarrow ZZ$ from $qq \rightarrow ZZ$ at high mass

ATLAS-CONF-2014-042

Γ/Γ_H^{SM} **observed limit 5.7 x SM @95% CL**
 ($gg \rightarrow ZZ$ background K-factor from higher-order QCD corrections is equal to the known signal K-factor)

Higgs Cross-section

arXiv:1407.4222 [hep-ex]

$H \rightarrow \gamma\gamma$

Measured cross sections and cross-section limits for $pp \rightarrow H \rightarrow \gamma\gamma$ in seven fiducial regions

Data compared to state-of-the-art theoretical predictions, regions include SM prediction arising from VBF, VH and ttH labelled as XH

arXiv:1407.4222 [hep-ex]

Sensitive to new physics in the context of production loop and properties

Jet multiplicity: sensitive to relative rates of production modes (ggH, VBF/VH/ZH, ttH)

$\Delta\phi_{jj}$: for ggH and VBF, sensitive to the Higgs boson spin and CP

$H \rightarrow \gamma\gamma$

- ❑ Higgs boson observed @ 125 GeV at the LHC and observation at Tevatron show consistency
- ❑ Di-Tau Higgs decay at LHC- First Indication of Higgs coupling to Leptons
- ❑ Coupling and Spin/Parity properties measured show consistency with SM expectations
- ❑ Continue the robust Higgs Physics programme at LHC Run 2 starting 2015

CMS Projection
