- Direct neutrino mass measurements
- ^{187}Re calorimetry with thermal detectors
- ^{163}Ho calorimetry with thermal detectors
- **HOLMES** experiment
- Conclusions

Neutrino properties

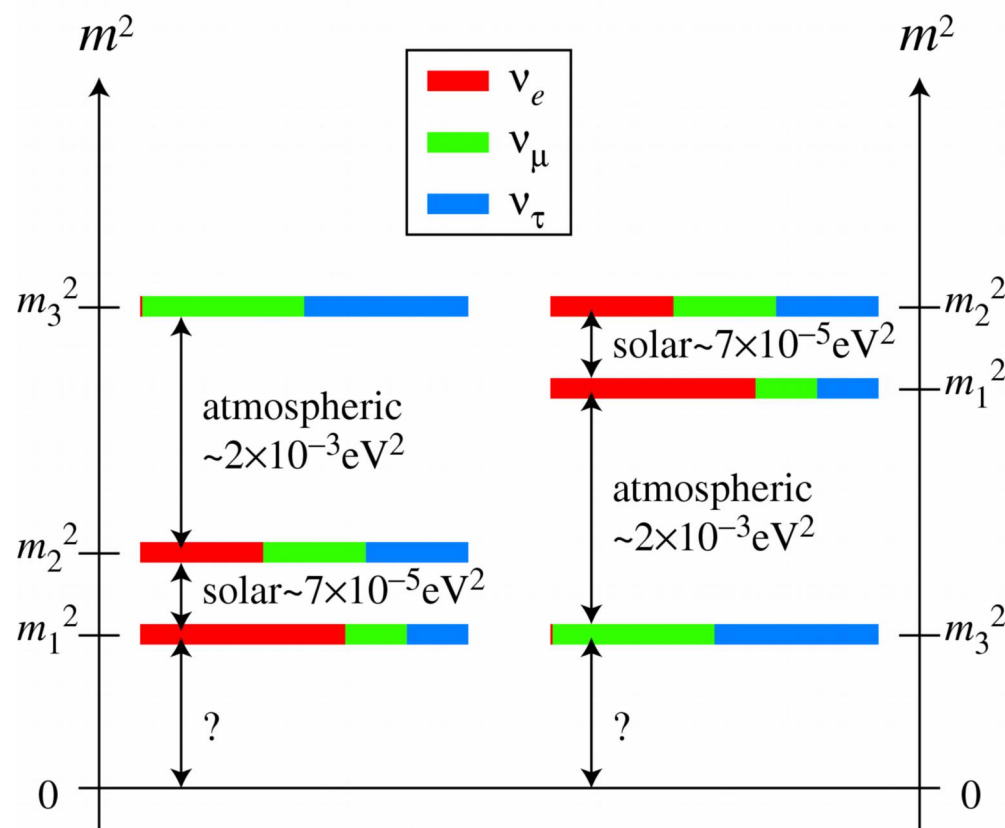

- neutrinos are massive fermions
- there are 3 active neutrino flavors
- neutrino flavor states are mixtures of mass states

→ neutrino oscillation experiments measure

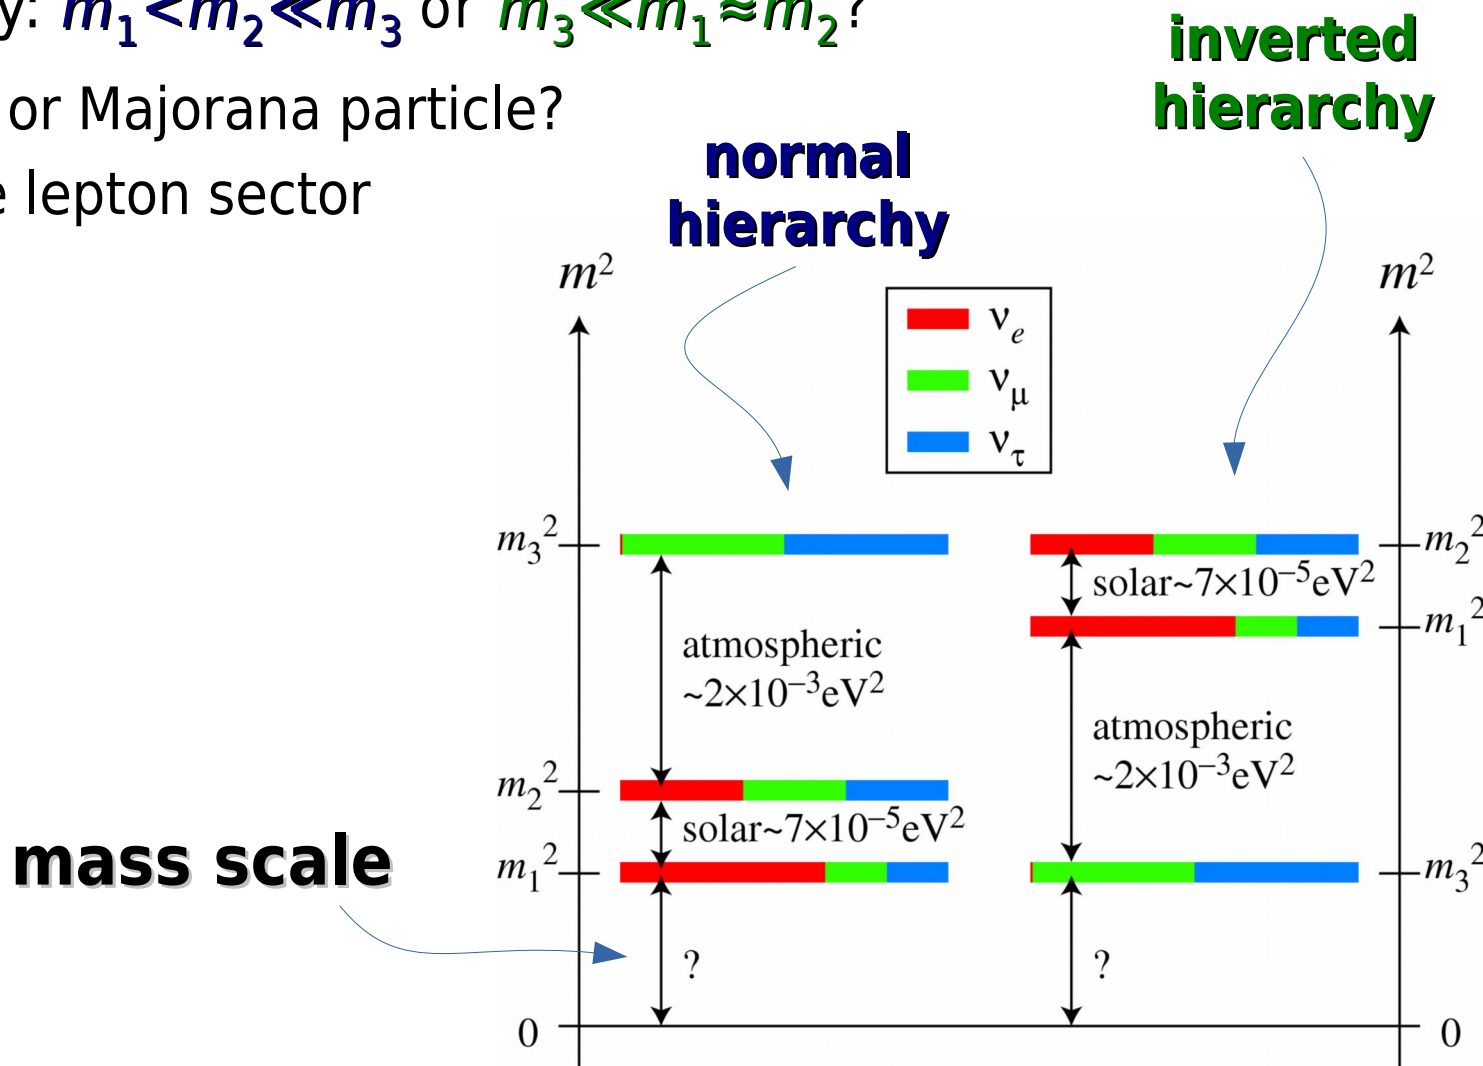

$$\Delta m_{ik}^2 = |m_i^2 - m_k^2|$$

$$\sin^2 2\theta_{ik} = f(|U_{Ik}|^2)$$

Neutrino open questions

- mass scale: i.e. mass of the lightest ν
- degenerate ($m_1 \approx m_2 \approx m_3$) or hierarchical masses
 - ▶ mass hierarchy: $m_1 < m_2 \ll m_3$ or $m_3 \ll m_1 \approx m_2$?
- $\nu = \bar{\nu}$? i.e. Dirac or Majorana particle?
- CP violation in the lepton sector

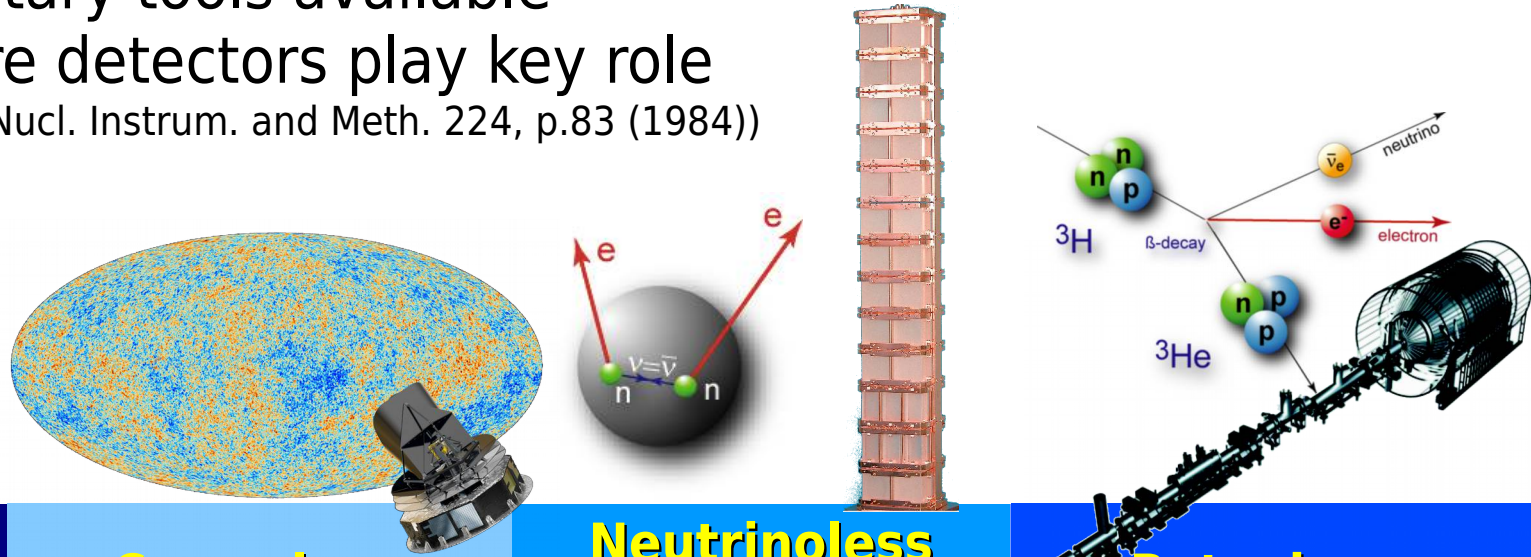

Mass scale: experimental tools / 1

three complementary tools available

→ low temperature detectors play key role

(E. Fiorini and T. Niinikoski, Nucl. Instrum. and Meth. 224, p.83 (1984))

Neutrinoless
Double Beta
decay

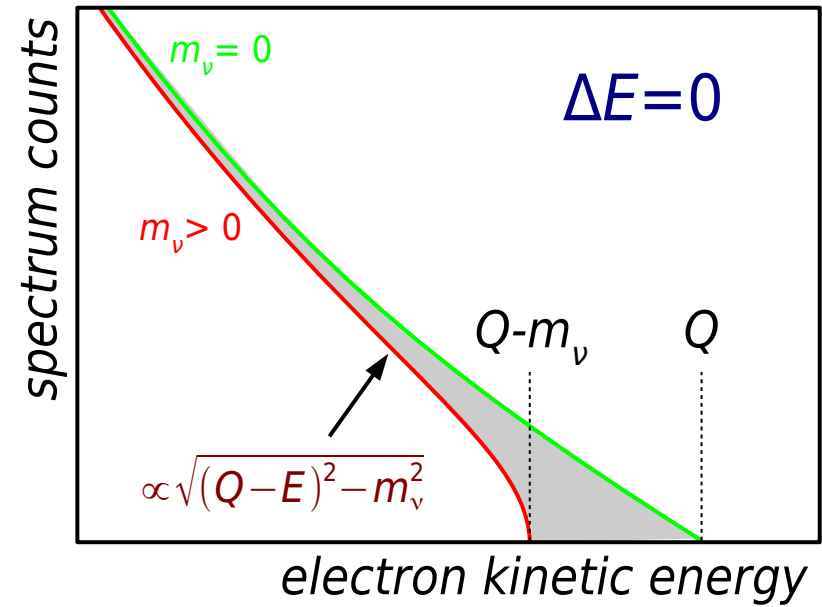

Direct neutrino mass measurements

kinematics of weak decays with ν emission

- ▶ low Q nuclear beta decays (${}^3\text{H}$, ${}^{187}\text{Re}$...)
- ▶ only energy and momentum conservation
- ▶ no further assumptions

2 approaches with different systematics:

- ▶ **spectrometry**: the β source is outside the detector
- ▶ **calorimetry**: the β source is contained in the detector which measures all the energy released except the ν energy

KATRIN

large MAC-E filter spectrometer with ${}^3\text{H}$

$\approx 5 \text{ mm}$

MARE/ECHO/HOLMES
array of low temperature microcalorimeters with ${}^{187}\text{Re}$ or ${}^{163}\text{Ho}$

Experimental approaches

Spectrometers: source \neq detector

β analyzer

differential or integral spectrometer: β s from the ^3H spectrum δE are magnetically and/or electrostatically selected and transported to the counter

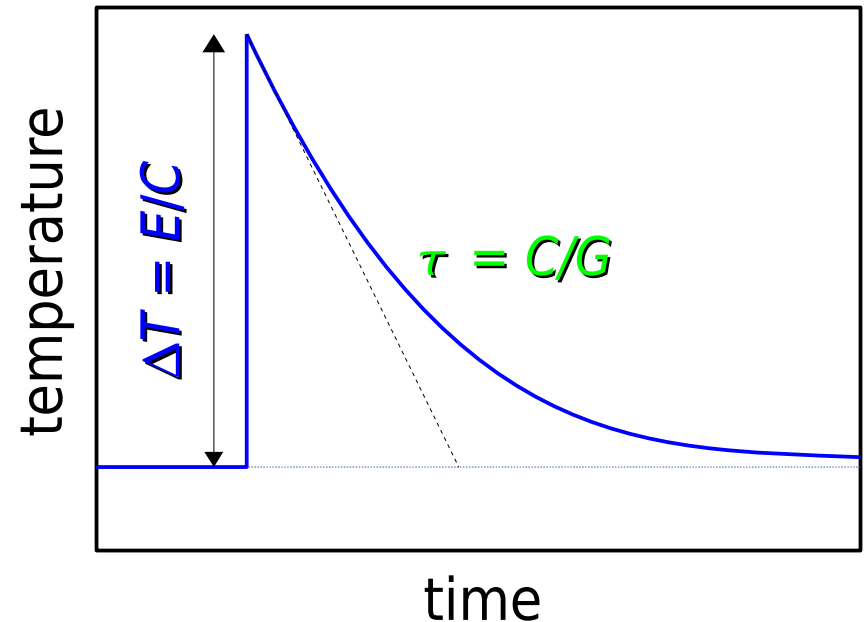

- ▲ high statistics
- ▲ high energy resolution
- ▼ large systematics
 - ▶ source effects
 - ▶ decays to excited states
- ▼ background

Calorimeters: source \subseteq detector

- ▲ no backscattering
- ▲ no energy losses in the source
- ▲ no atomic/molecular final state effects
- ▲ no solid state excitation
- ▼ limited statistics
- ▼ pile-up background
- ▼ spectrum related systematics

Calorimetry with low temperature detectors (LTD)

1 mg of Re @ 100 mK
 $C \sim T^3$ (Debye) $\rightarrow C \sim 10^{-13}$ J/K
 $\rightarrow \Delta E_{rms} \sim 1$ eV
 6 keV x-ray $\rightarrow \Delta T \sim 10$ mK
 $G \sim 10^{-11}$ W/K $\rightarrow \tau = C/G \sim 10$ ms

- ▷ complete energy *thermalization* (ionization, excitation \rightarrow heat) \rightarrow **calorimetry**
- ▷ $\Delta T = E/C$ with C total thermal capacity (phonons, electrons, spins...) phonons: $C \sim T^3$ (Debye law) in dielectrics or superconductors below T_c \rightarrow low T (i.e. $T \ll 1$ K)
- ▷ $\Delta E_{rms} = (k_B T^2 C)^{1/2}$ due statistical fluctuations of internal energy E
- ▷ $\Delta T(t) = E/C e^{-t/\tau}$ with $\tau = C/G$ and G thermal conductance

Calorimeter statistical sensitivity

resolving time τ_R analysis interval ΔE
 source activity A_β number of detectors N_{det}
 pile-up fraction $f_{pile-up} = \tau_R A_\beta$
 experimental exposure $t_M = T \times N_{det}$

$$N_\beta(E, m_\nu) \approx \frac{3}{E_0^3} (E_0 - E)^2 \sqrt{1 - \frac{m_\nu^2}{(E_0 - E)^2}}$$

$$F_{\Delta E}(m_\nu) = A_\beta N_{det} \int_{E_0 - \Delta E}^{E_0} N_\beta(E, m_\nu) dE \quad F_{\Delta E}(0) \approx A_\beta N_{det} \frac{\Delta E^3}{E_0^3} \rightarrow {}^{187}\text{Re } E_0 = 2.5 \text{ keV}$$

$$f_{pile-up} = \tau_R A_\beta \ll \frac{\Delta E^2}{E_0^2} \quad \text{negligible pile-up}$$

$$\Sigma_{90}(m_\nu) \approx 0.89 \sqrt[4]{\frac{E_0^3 \Delta E}{A_\beta t_M}}$$

experimental challenges

- ▶ energy resolution ΔE_{FWHM}
- ▶ time resolution τ_R
- ▶ exposure $t_M = N_{det} \times T$
- ▶ single channel activity A_β

^{187}Re experiments: MANU-MIBETA ... MARE

- proposed since 1985 by Genova group
- **MIBETA** @ MiB with AgReO_4
 - ▶ $m_\nu < 15$ eV 90% C.L. 
 - M.Sisti et al., NIM A 520 (2004) 125
- **MANU** @ Ge with metallic Re
 - ▶ $m_\nu < 26$ eV 95% C.L.
 - F.Gatti, Nucl. Phys. B91 (2001) 293
- **first ^{187}Re experiments: $N_{\text{ev}} \approx 10^7$ events**

MARE (Microcalorimeter arrays for a Rhenium Experiment)

- project for a sub-eV direct neutrino mass measurement
- wide international interest since Orlando (USA) meeting in 2007
- phased approach to optimize detectors technology

^{187}Re experiment statistical sensitivity / 1

^{187}Re past measurements

- ▶ total statistics $N_{\text{ev}} \approx 10^7$ events

Rhenium experiment status and future

- Re detector development → no good results after 20+ years of R&D
 - ▶ no clear understanding of Re absorber physics
 - ▶ purity and superconductivity?
 - ▶ extra heat capacity C due to nuclear quadrupole moment?
- low specific activity → “large” masses → fabrication issues
- possible large systematics
 - ▶ Beta Environmental Fine Structure (BEFS)
 - ▶ detector energy response function
- future of Re experiments is not very bright...

BEFS in ^{187}Re
 $N_{ev} = 10^{10}$
 $\Delta E = 5 \text{ eV}$
 $f_{pp} = 10^{-5}$

Electron capture end-point experiment / 1

electron capture from shell \geq M1

A. De Rujula and M. Lusignoli, Phys. Lett. B 118 (1982) 429

- calorimetric measurement of Dy atomic de-excitations (mostly non-radiative)
- rate at end-point and ν mass sensitivity depend on Q
 - ▶ Measured: $Q_{\text{EC}} = 2.2 \div 2.8$ keV. Recommended: $Q = 2.555$ keV
- $\tau_{1/2} \approx 4570$ years \rightarrow few active nuclei are needed

$$\frac{d\lambda_{\text{EC}}}{dE_c} = \frac{G_{\beta}^2}{4\pi^2} (Q - E_c) \sqrt{(Q - E_c)^2 - m_{\nu}^2} \times \sum_i n_i C_i \beta_i^2 B_i \frac{\Gamma_i}{2\pi} \frac{1}{(E_c - E_i)^2 + \Gamma_i^2/4}$$

Electron capture end-point experiment / 2

- no direct **calorimetric** measurement of Q so far
- Q and atomic de-excitation spectrum poorly known
- complex **pile-up spectrum**
 - ▶ end-point spectrum shaped by $(Q - E_c)\sqrt{(Q - E_c)^2 - m_\nu^2}$ but...

$$N_{ev} = 10^{14}$$

$$f_{pp} = 10^{-6}$$

$$\Delta E_{FWHM} = 2 \text{ eV}$$

Statistical sensitivity: Montecarlo simulations

- 2×10^{11} ^{163}Ho nuclei \rightarrow 1 decay/s
- ^{163}Ho production: p.e. neutron irradiation of ^{162}Er enriched Er
- embed ^{163}Ho in thermal detectors for low energy X-rays spectroscopy

- ▶ high energy resolution $\approx 1\text{eV}$
- ▶ fast response $\approx 1\mu\text{s}$
- ▶ large multiplexable array ≈ 1000

$$\propto \sqrt[4]{1/N_{ev}}$$

Holmium experiment status

■ ^{163}Ho seems to be better than ^{187}Re

- ▶ higher specific activity → don't need a “Holmium detector”
- ▶ *self calibrating* → better systematics control
- ▶ **but**
 - higher Q → maybe less sensitive
 - pile-up spectrum
 - chemical effects on Q

■ (at least) **two projects**

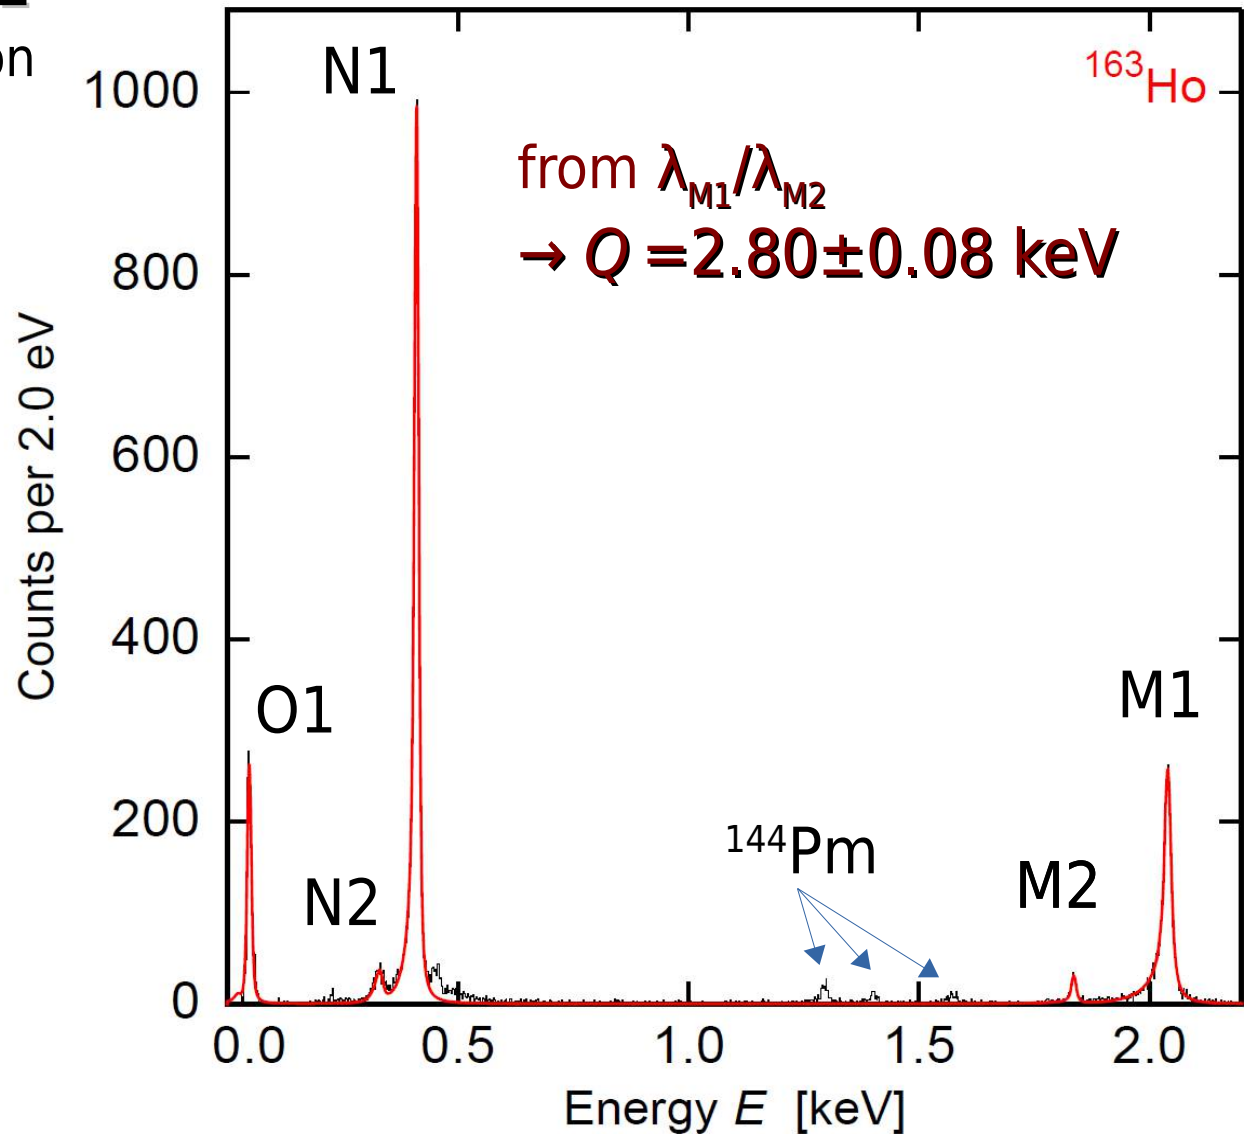

- ▶ **ECHO** (Heidelberg)
- ▶ **MARE** (→ now HOLMES)
- ▶ Los Alamos National Lab., Stanford University ?, ...

■ **common technical challenges**

- ▶ clean ^{163}Ho production
- ▶ ^{163}Ho incorporation
- ▶ large channel number → high speed multiplexing
- ▶ data handling (processing, storage, ...)

ECHO experiment

- Magnetic Metallic Calorimeters with Au absorbers (2 pixels)
 - ▶ $\Delta E \approx 8$ eV and $\tau_{\text{rise}} \approx 130$ ns
- p on W/Ta target at ISOLDE
 - ▶ online separation/implantation
 - ▶ $\approx 10^{10}$ ^{163}Ho nuclei

goal

- neutrino mass measurement: m_ν statistical sensitivity as low as 0.4 eV
- prove technique potential and scalability:
 - ▶ assess EC Q-value
 - ▶ assess systematic errors

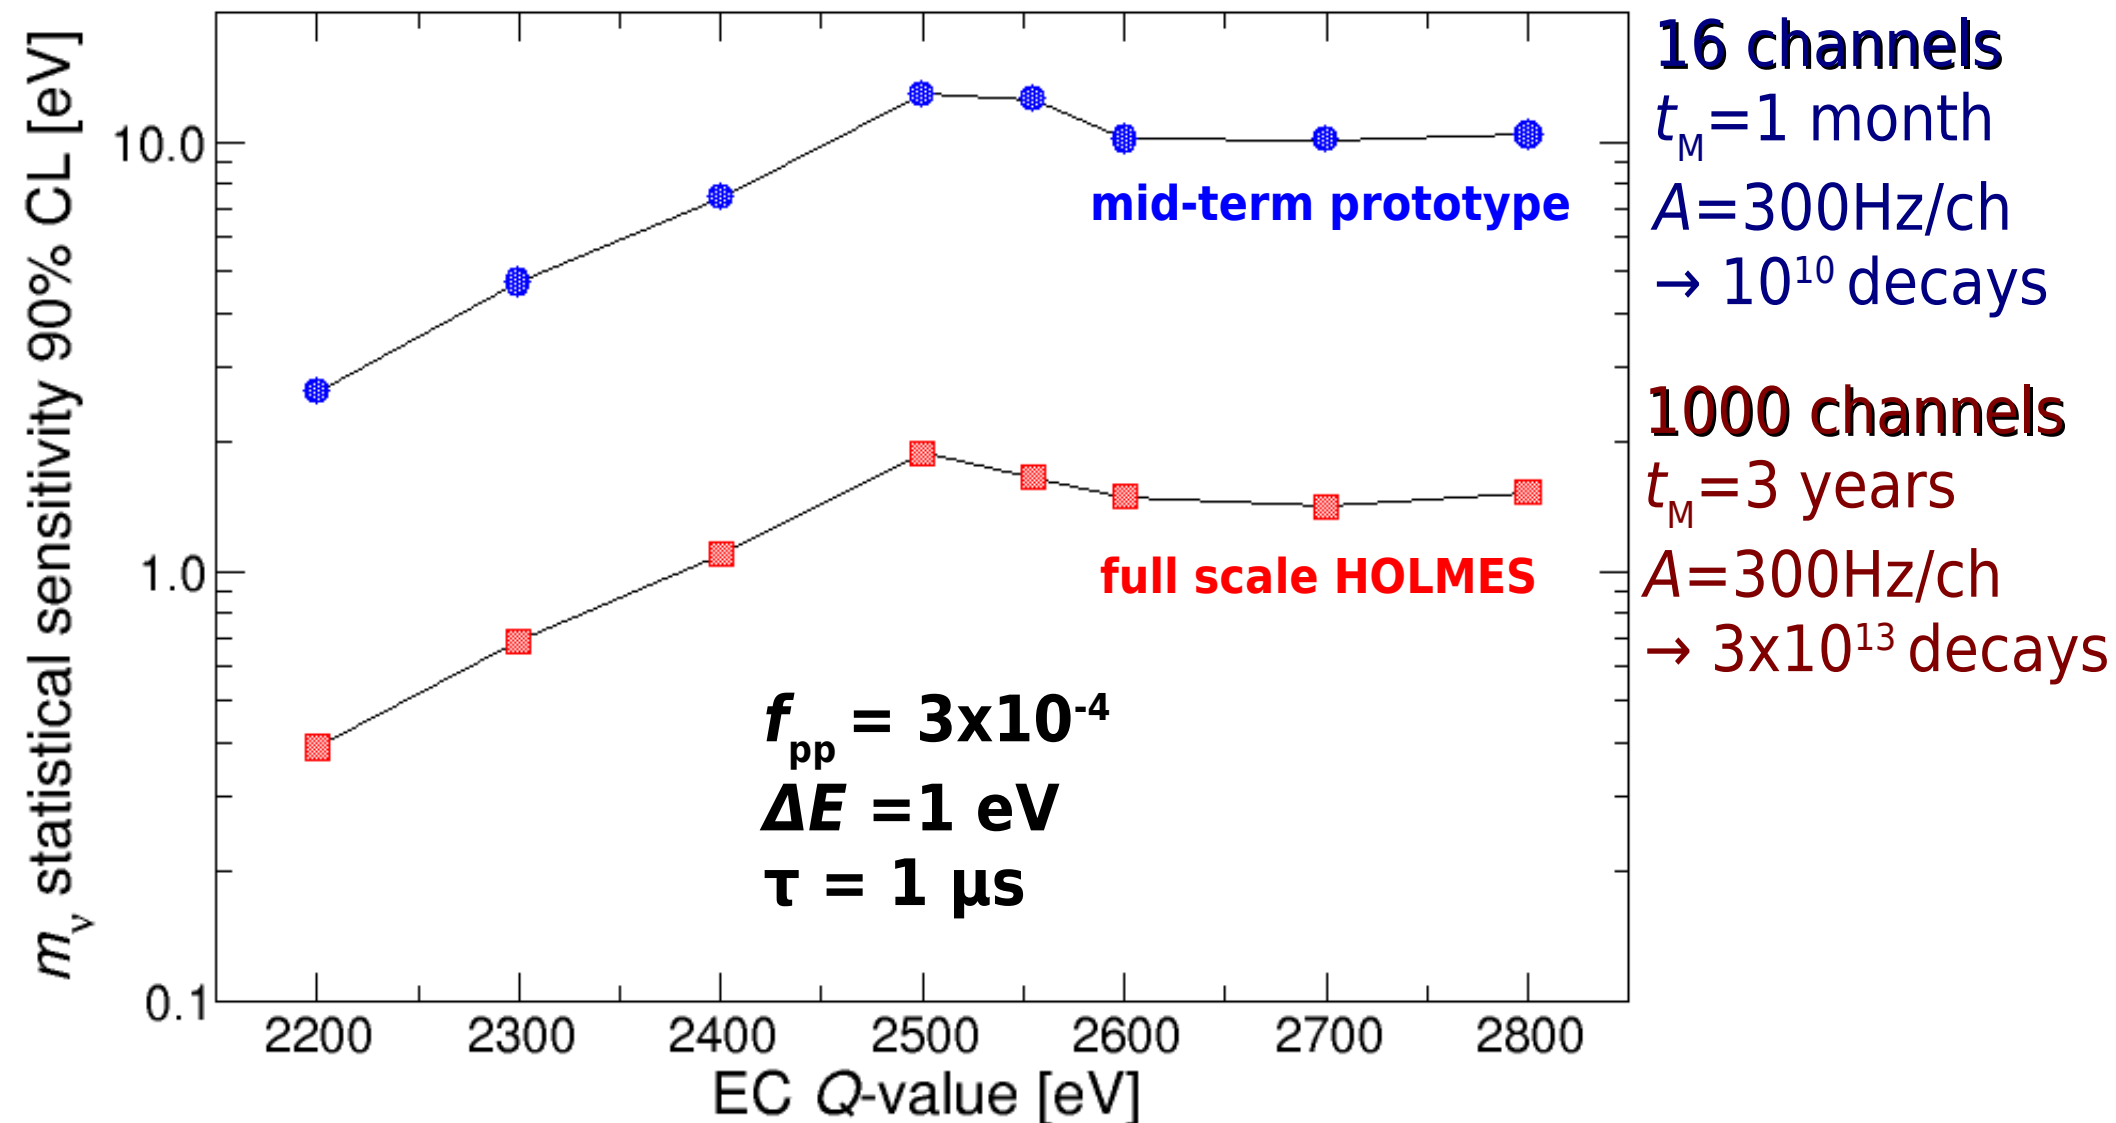

baseline

- Transition Edge Sensors (TES) with ^{163}Ho implanted Au absorbers
 - ▶ 6.5×10^{13} nuclei per detector \rightarrow 300 dec/sec
 - ▶ $\Delta E \approx 1\text{eV}$ and $\tau_R \approx 1\mu\text{s}$
- 1000 channel array
 - ▶ 6.5×10^{16} ^{163}Ho nuclei $\rightarrow \approx 18\mu\text{g}$
 - ▶ 3×10^{13} events in 3 years

\rightarrow Project Start: 1 Feb 2014

- fluorescent X-rays and X-ray escape lines

- **γ and β from close surroundings**

- **cosmic rays**

- muons, ...
- EM showers

- ...

Cosmic rays at sea level (muons)

- **Au pixel**: $200 \times 200 \times 3 \mu\text{m}^3$

▷ $\langle \Delta E \rangle \approx 10 \text{keV}$, $r \approx 1 \text{d}^{-1}$

- **array Si substrate**: $20 \times 20 \times 0.5 \text{mm}^3$

▷ $\langle \Delta E \rangle \approx 300 \text{keV}$, $r \approx 7000 \text{d}^{-1}$

- **MIBETA**: $300 \times 300 \times 150 \mu\text{m}^3$ AgReO_4 crystals

▶ $\text{bkg}(2..5 \text{keV}) \approx 1.5 \times 10^{-4} \text{c/eV/d/det}$

- **TES @NIST (1600m)**: $350 \times 350 \times 2.5 \mu\text{m}^3$ Bi absorbers

▶ $\text{bkg} < 1 \text{c/eV/d/det}$ (preliminary measurement: not conclusive...)

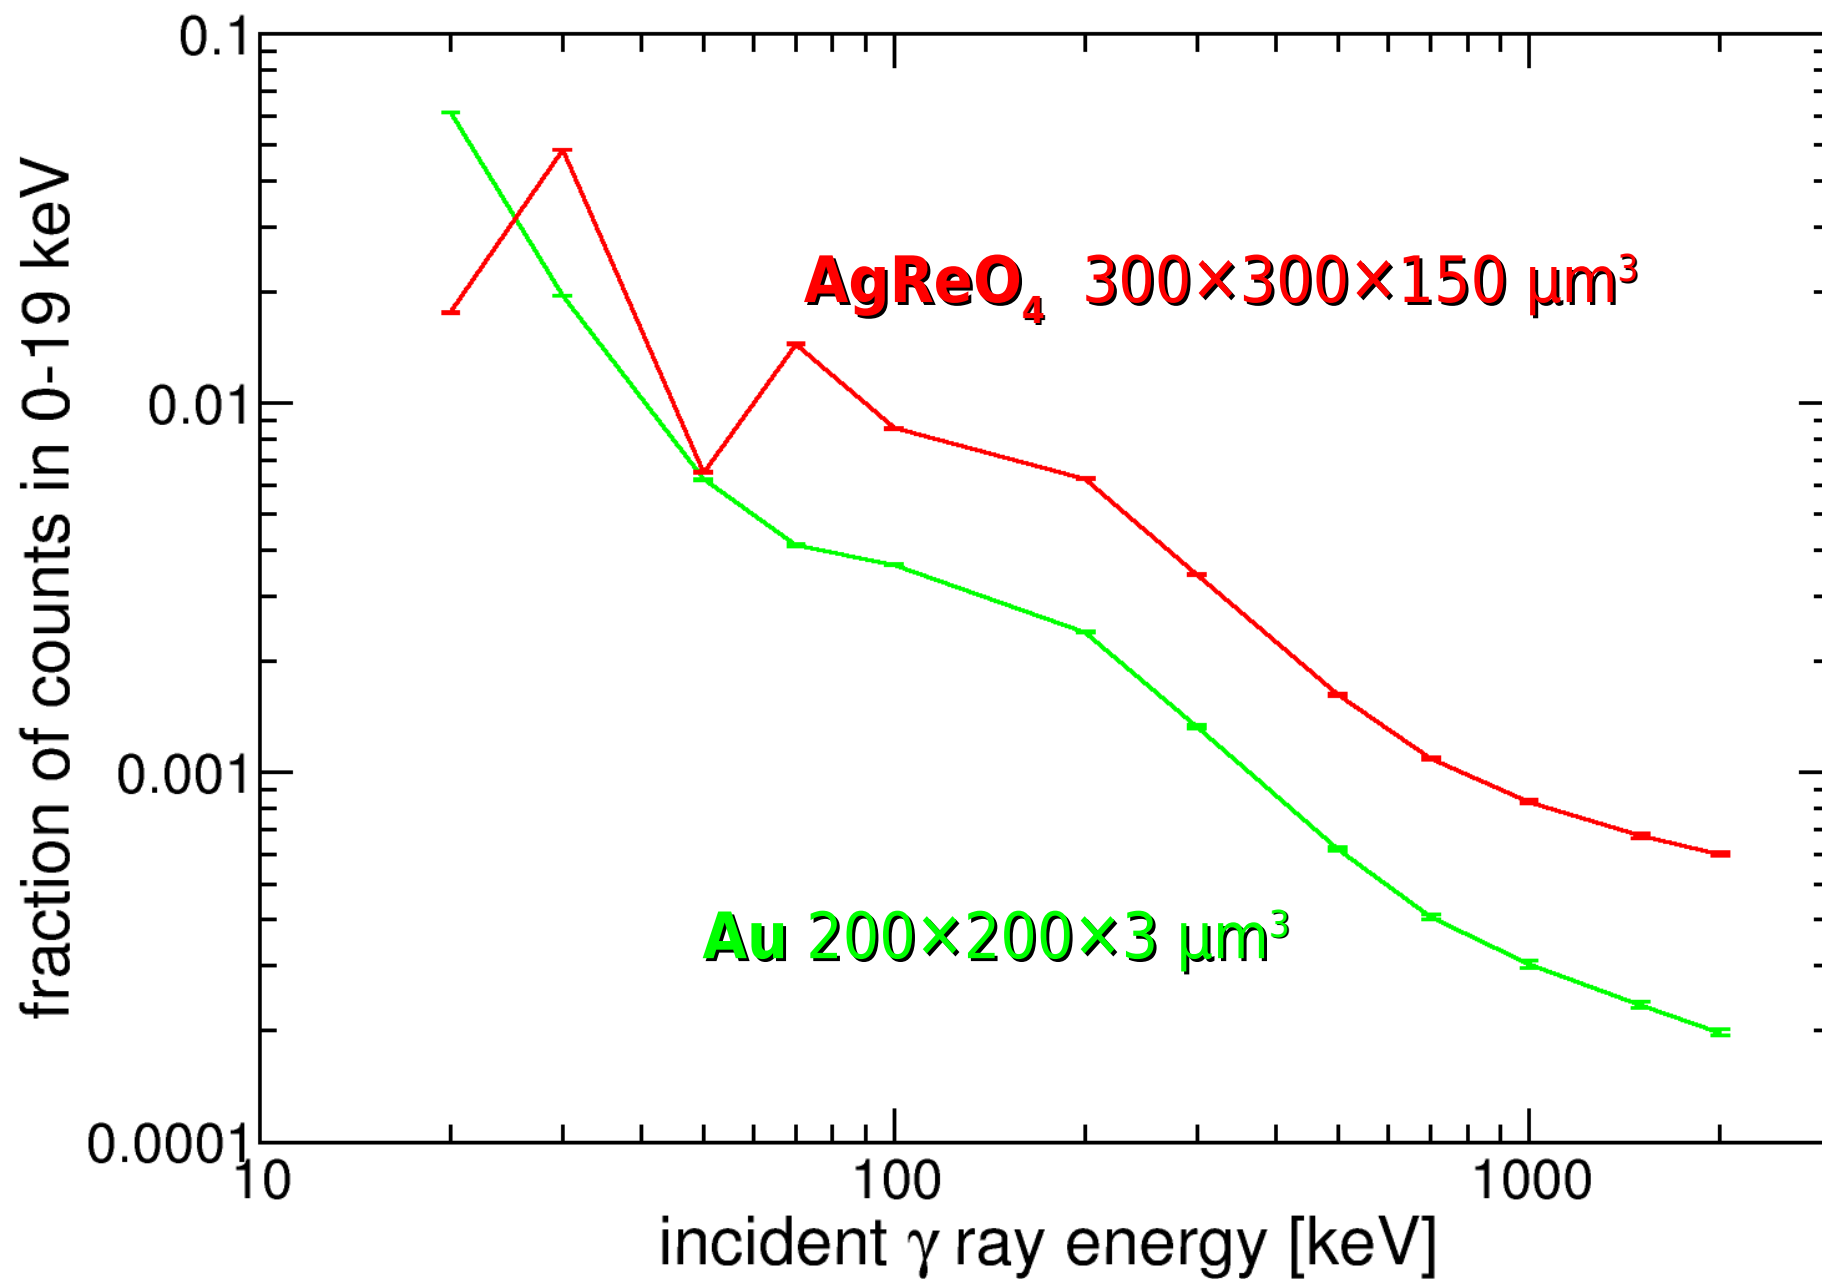

Effect of background on sensitivity

A=3Hz/det
 $f_{pp} = 3 \times 10^{-6}$

A=300Hz/det
 $f_{pp} = 3 \times 10^{-4}$

Low energy background sources / 2

HOLMES tasks

- **^{163}Ho isotope production**
- **^{163}Ho isotope embedding in detector**
- single TES optimization and testing
- TES array design, engineering and testing
- **SQUID read-out and multiplexing optimization and testing**
- **room temperature signal processing and in-line analysis**
- cryogenic set-up

^{163}Ho production and embedding

■ ^{163}Ho production by nuclear reaction

- ▶ high yield
- ▶ low by-products contaminations (in particular $^{166\text{m}}\text{Ho}$, β $\tau_{1/2}=1200\text{y}$)
- ▶ not all cross sections are well known
 - neutron activation of enriched ^{162}Er (nuclear reactor)
 - $^{163}\text{Dy}(p,n)^{163}\text{Ho}$ $E_p > 10$ MeV (direct, low yield → PSI?)
 - $^{\text{nat}}\text{Dy}(\alpha,xn)^{163}\text{Er}$ and $^{159}\text{Tb}(^7\text{Li}, 3n)^{163}\text{Er}$

HOLMES baseline

■ ^{163}Ho Separation from Dy, Er and more ...

- ▶ radiochemistry (before and/or after irradiation)
- ▶ magnetic mass separation
- ▶ resonance ionization laser ion source (RILIS)?

■ ^{163}Ho embedding in detector absorber

- ▶ implantation (+magnetic separation)
- ▶ Au film deposition for full containment

- lower yield
- many high energy neutrons produced by (p,xn) on Dy isotopes
 - ▶ $^{165}\text{Ho}(n,\gamma)$ (from Ho contaminations or $^{164}\text{Dy}(n,\gamma)$) → ^{166m}Ho , β^- $\tau_{1/2} = 1200\text{y}$

MARE-RD: ^{163}Ho production

- ^{163}Ho production by Er: ^{162}Er enriched neutron irradiation
 - ▷ 3 irradiations at Lisboa research reactor (ITN)
 - ▷ 1 irradiation at Grenoble reactor (ILL) → >10MBq of ^{163}Ho (now *cooling...*)
- $\text{Er}_2\text{O}_3/\text{Ho}_2\text{O}_3$ thermoreduction → metallic target for implantation
 - ▷ $\text{Y}_5\text{Si}_3 + \text{Ho}_2\text{O}_3 \rightarrow \text{Y}_{5-x}\text{Ho}_x\text{Si}_3$ a 600-800°C: **didn't work out...**
 - ▷ $\text{Ho}_2\text{O}_3 + 2\text{Y}(\text{met}) \rightarrow 2\text{Ho}(\text{met}) + \text{Y}_2\text{O}_3$ at 2000°C: **it worked...**
- effect of Ho/Er implantation in Au absorbers
 - ▷ magnetic contributions to Au heat capacity due to hyperfine interactions

MARE-RD: Ho oxide reduction

- Ho₂O₃ distillation around 2000K
- XPS on deposited film:
 - 80% metallic Ho
 - 20% re-oxidized Ho

MARE-RD: tests on irradiated samples

- sample from irradiated Er_2O_3 (^{162}Er enriched at 20%) powder (#2)
- $\text{Er}_2\text{O}_3/\text{Ho}_2\text{O}_3$ distillation at $\approx 2000\text{K}$
- deposition on thinned Sn single crystal

sandwiched Sn absorbers
coupled to
Si implanted thermistors

- ▶ no ^{163}Ho peaks
- ▶ continuum $\approx 1\text{c/s}$
→ β from ^{152}Eu in irradiated sample?
- ▶ more tests...
- ▶ sample analysis ICPMS (@LNGS), ...
- ▶ sample purification

HOLMES detectors

- Transition Edge Sensors (TES) with Bi/Au absorber
 - ▷ hot electron microcalorimeters with electro-thermal feedback
 - ▷ 2 μm thick electrodeposited Au for full absorption
- MoAu or MoCu proximity TES $\rightarrow T_c \approx 100\text{mK}$
- on Si_2N_3 membrane

NASA/GSFC

HOLMES detector array fabrication

- single pixel development @Genova
 - ▷ optimize design for speed and resolution
 - ▷ define process for ^{163}Ho implantation
- array design @Genova
- subcontract array fabrication (NIST, Boulder, USA)
 - ▷ subcontractor fabricates array with 1 μm Au absorber
- Genova completes array fabrication
 - ▷ Genova implants ^{163}Ho at shallow depth ($\approx 100\text{\AA}$)
 - ▷ Genova covers implant with 1 μm Au absorber
 - ▷ Genova completes array fabrication (Si_2N_3 release)

HOLMES detector array

NASA/GSFC

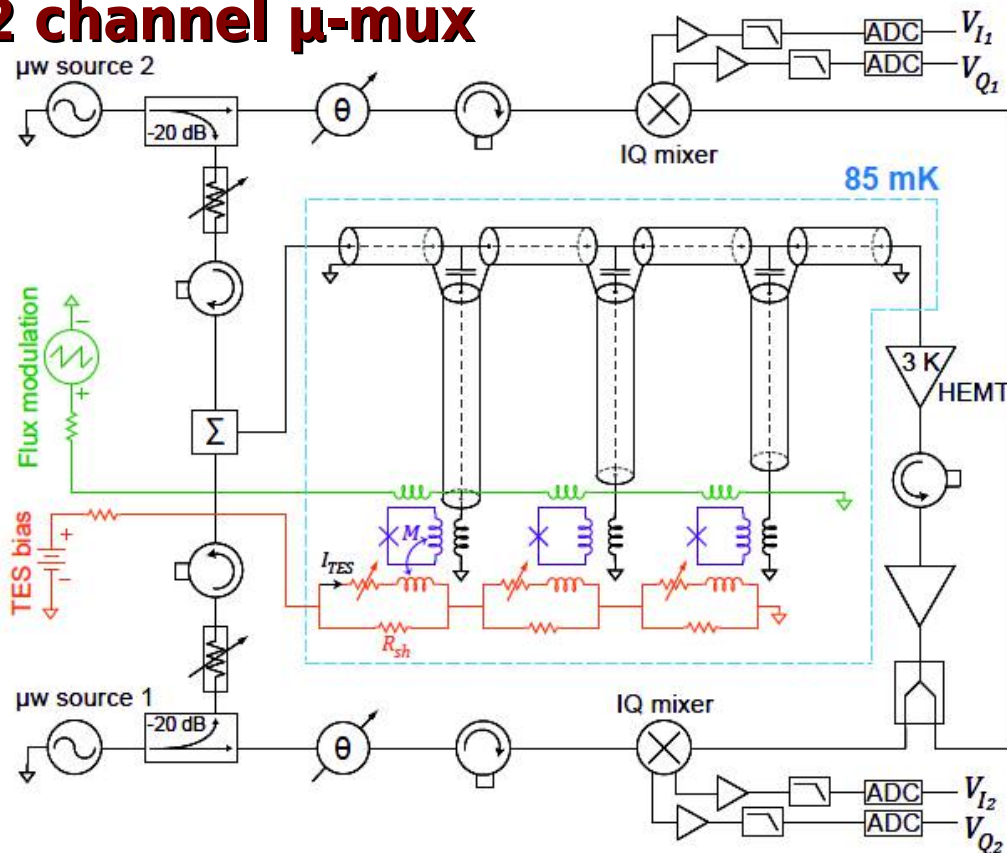

NIST

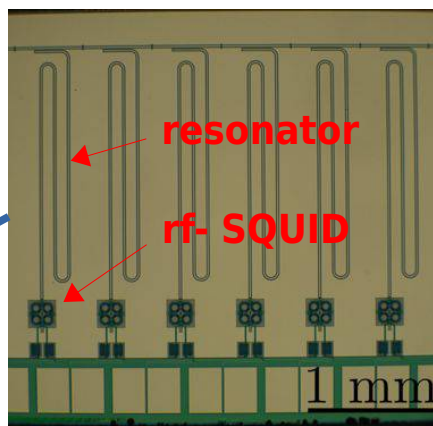

→ **HOLMES array: 256 sparse pixels (4x)**

HOLMES array multiplexing: RF SQUID mw-mux

2 channel μ -mux

O. Noroozian et al., "High-resolution gamma-ray spectroscopy with a microwave-multiplexed transition-edge sensor array", proceedings LTD-15 arXiv:1310.7287

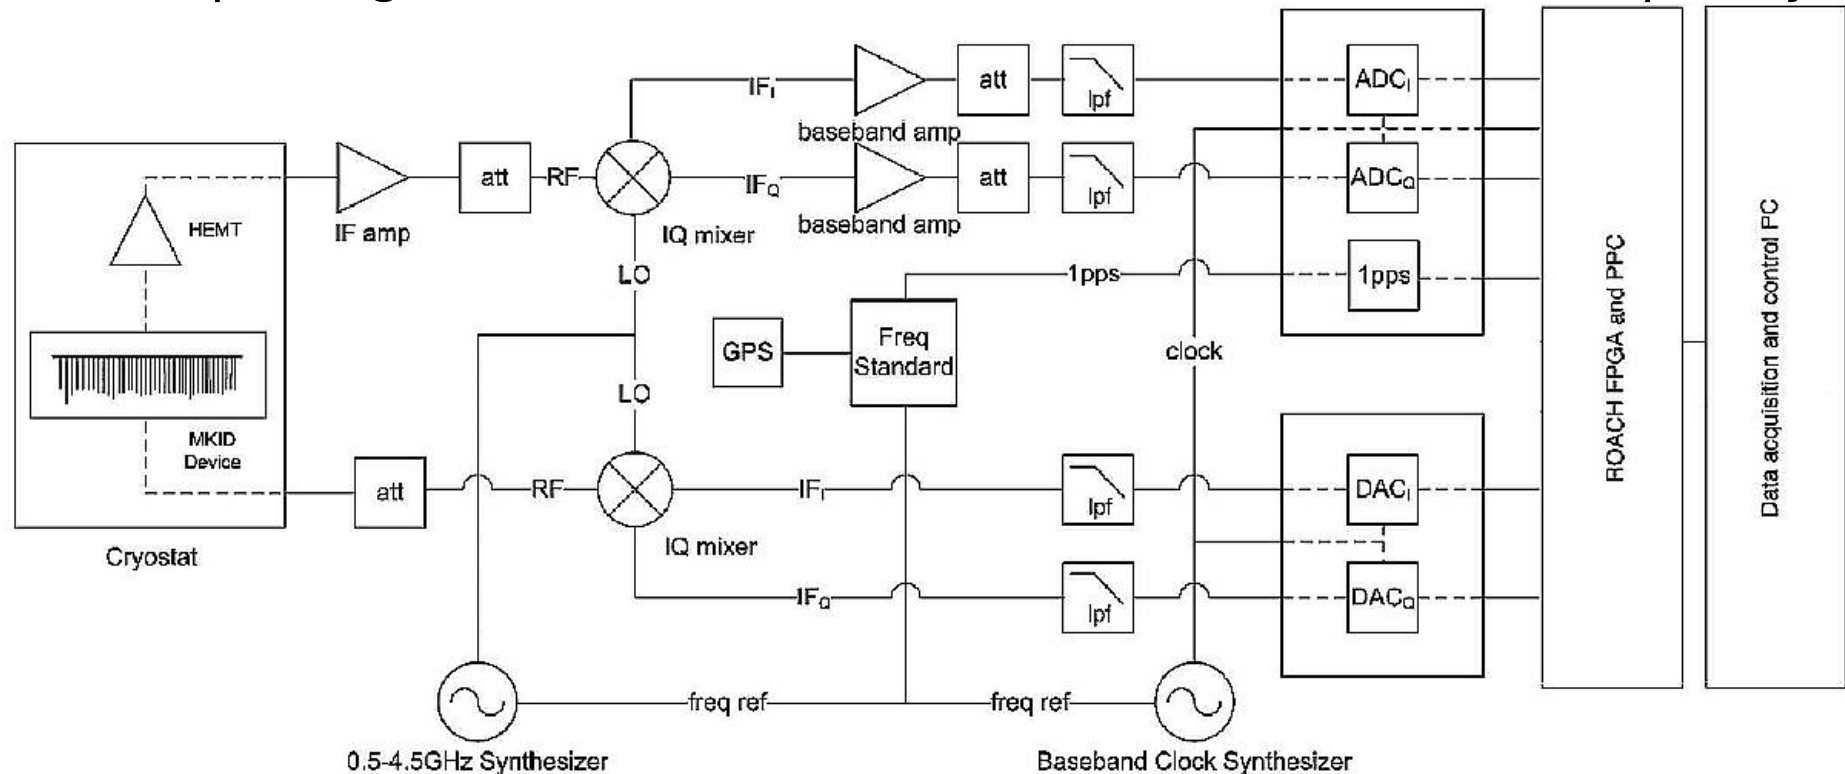

- dc TES biasing
- always ON TESs

$$\phi = \frac{2\pi M}{\Phi_0} I_{TES}$$

$$\phi = \arctan\left(\frac{\sum V_Q \sin \omega_m t}{\sum V_Q \cos \omega_m t}\right)$$

HOLMES array multiplexing: DAQ

Digital multiplexing (Software Defined Radio) based on ROACH-2 open system

mux factor: 64

ADC: 550MS/s 12 bit

bandwidth/channel: 8.6MHz

bandwidth for 1 μ s rise time: 160kHz

→ 64 resonances between 0 and 550MHz

→ up-conversion → 5-5.5GHz

→ down-conversion → 0-500MHz

→ IQ signal demux

→ rfSQUID signal demodulation

HOLMES array multiplexing / 3

4x

HOLMES signal processing and in-line analysis

data throughput with digitized pulses
 3×10^5 decay/s \times 2k (rec len) \times 16 bit = 2.5GB/s

- reduce resolution (12 bit) and record length (256)
- use variable sampling time
- **real time pulse processing**
 - ▶ optimal filtering, pile-up detection, pulse shape analysis
- commissioning and periodic minimum bias samples
 - ▶ tune parameters for real time pulse processing in normal data taking
 - ▶ full waveform saved to disk for immediate off-line analysis
 - ▶ full spectrum (10% live time) and with ≈ 2.0 keV threshold (90%)
 - ▶ **2TB/day** (to be stored only temporary)
- normal data taking
 - ▶ save only n-tuples (8×4 byte words) for each event above ≈ 2.0 keV
 - ▶ **140TB in 3 years**

Alternatives to HOLMES baseline

- **^{163}Ho production route** (baseline: neutron activation of ^{162}Er)
 - ▷ $^{163}\text{Dy}(p,n)^{163}\text{Ho}$ $E_p > 10$ MeV at PSI
- **Detector technology** (baseline: TES with multiplexed SQUID read-out)
 - ▷ Thermal mode microresonators with microwave multiplexing (FBK)
- **Detector read-out** (baseline: ~~Code Division Multiplexing with dcSQUID~~)
 - ▷ **microwave rfSQUID multiplexing**
 - ▷ microwave mux with Kinetic inductance parametric up-converter

large arrays for high flux high resolution X-rays spectroscopy

- astrophysics → ATHENA, ...
- material science → XAS, XAS imaging, XRF, XES ...
 - ▷ chemistry and biology
 - ▷ archeometry
 - ▷ ...
- time resolved sub-picosecond XAS
- nuclear safeguard and nuclear reactor fuel diagnostic

HOLMES schedule

Activities	Tasks	Project year									
		Y1		Y2		Y3		Y4		Y5	
		6	12	18	24	30	36	42	48	54	60
Isotope production	Production optimization	█	█	█							
	Final production				█	█					
Pixel optimization	TES sensor design optimization and tests	█	█	█							
	Absorber ¹⁶³ Ho embedding	█	2								
	Absorber with isotope optimization		█	█	█						
Array	Prototype production and testing		█	█							
	4x4 array production				█						
	32x32 array engineering and production					█	█				
Multiplexed read-out	SQUID/MUX development and tests	█	1	█							
	SQUID/MUX prototype				█						
	SQUID and MUX production					█	█				
RT electronics and data processing	Analog/digital signal processing R&D and tests	█	█	█	█						
	Analog/digital signal processing for prototype					█					
	Analog/digital signal processing for HOLMES						█	█			
	Server and storage system					█	█	█			
Software Tools	Neutrino mass analysis package	█	█	█	█						
	In-line signal processing algorithm development			█	█	█	█				
Cryogenics	Temporary set-up for testing	█									
	Dilution refrigerator installation	█	█								
	Set-up for prototype measurement					█

● key measurements

HOLMES present status

- irradiated Er_2O_3 sample with 10MBq ^{163}Ho **cooling** at ILL reactor
- irradiated Er_2O_3 samples ICP-MS analysis **in progress**
- Ho distillation/reduction system assembly **in progress**
- custom ion implanter design **in progress**
- optimized TES design **in progress** (with NIST)
- upgrade of TES fab facility @Genova **in progress**
- cryogen free Oxflinst Triton200 refrigerator **in production**
- TES testbed with muxed micro-wave read-out installation **in progress**
- microwave multiplexed rfSQUID read-out design **in progress**
- ROACH-2 system for testing **delivered**

first TES detectors with implanted ^{163}Ho : July 2015

- **HOLMES is challenging project!**
 - it will assess the real potential of ^{163}Ho experiments
 - it will give interesting limits on the neutrino mass
 - it may be a technology demonstrator for an experiment with ≤ 0.1 eV sensitivity
