## The SPARC\_Lab Thomson Source

*Monday, 14 September 2015 17:00 (20 minutes)*

The SPARC\_LAB Thomson source is a compact X-rays source based on the Thomson backscattering process presently under its second phase of commissioning at LNF. The electron beam energy ranges between 30-150 MeV, the electrons collide head-on with the Ti:Sapphire FLAME laser pulse with energy ranges between 1 and 2.5 J with pulse lengths in the 0.1-10 psec range, this provides a Xrays yield energy tunability in the range of 20-500 keV, with the further capability to generate strongly non-linear phenomena and to drive diffusion processes due to multiple and plural scattering effects. The experimental results on the obtained X-ray radiation and its characterization are presented.
