

# LHCb RICH Upgrade

Current LHCb RICH Configuration

○ Luminosity projection based on experience in Run 1 and updated schedules:

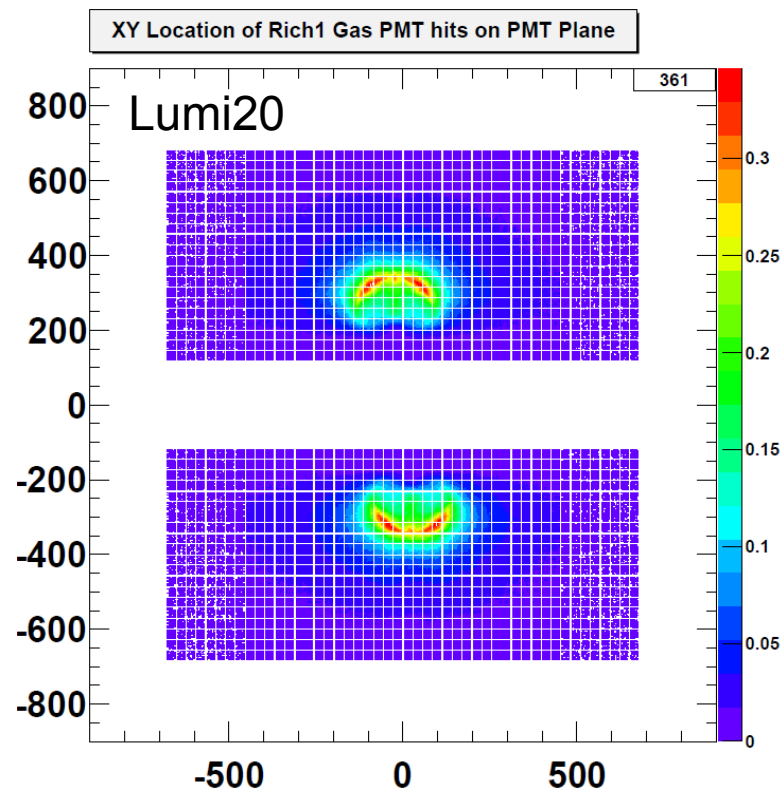

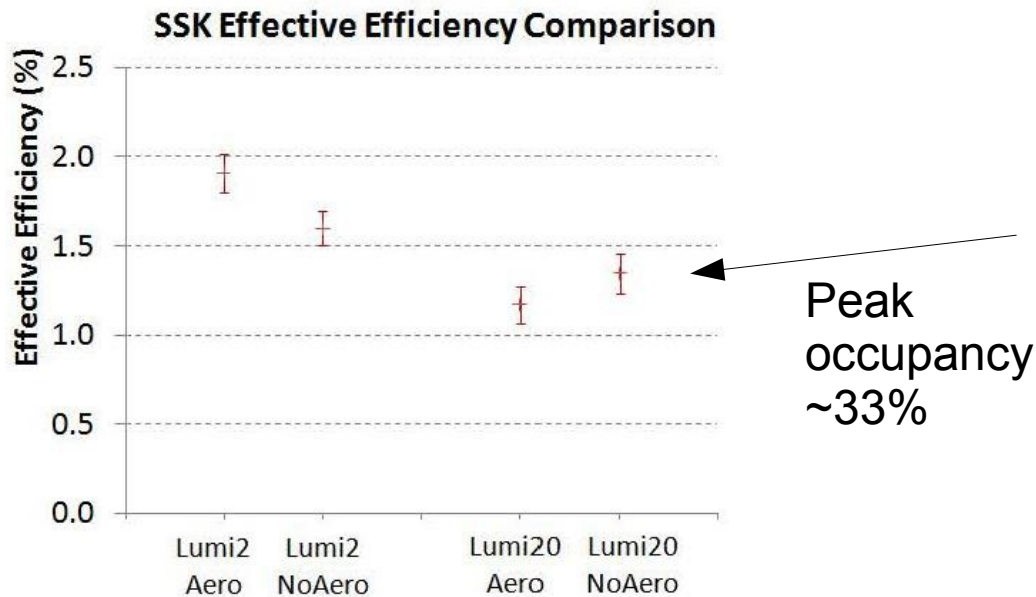

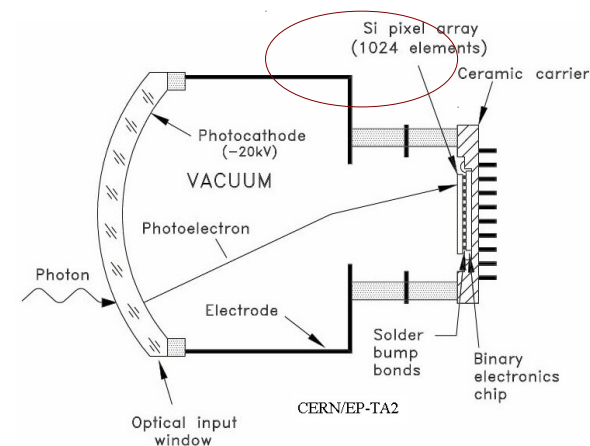

○ Ideally collect 10 fb<sup>-1</sup> before LS2, thus another 7 fb<sup>-1</sup>

→ Attractive to extend Run 2 by ~one year or so

→ Note, however that the LHCb expected system lifetime (trackers) at 10 fb<sup>-1</sup>

# RICH Upgrade Motivation

- Amount of recorded data limited by trigger rate  $\Rightarrow$  upgrade the electronics to 40MHz trigger rate
- RICH HPD have embedded FE electronics limited at 1MHz  $\Rightarrow$  replace
- Luminosity increase from 4 to 20  $10^{32} \text{ cm}^{-2}\text{s}^{-1}$ 
  - $\Rightarrow$  Degradation due to high occupancy
    - Change the design
  - $\Rightarrow$  Aerogel material degrades the tagging performance
    - Remove

# Aerogel Removal and HPD maintenance

- Even at low luminosity aerogel contribution to PID performance is marginal
  - Limited to low momentum tracks
  - Slow reconstruction => cannot be used in HLT to reduce the charm rate
  - Calibration difficult due to diffusion of  $CF_4$  inside aerogel
  - Blocks 10-20% of the Cherenkov photons from the gas
    - Removing it will improve the kaon pion separation at high momenta
- => Aerogel will actually be removed before the start of run2
- Support for HPD maintenance from Electronics Shop in September 2014
  - G.Rampazzo and P.L.Zatti

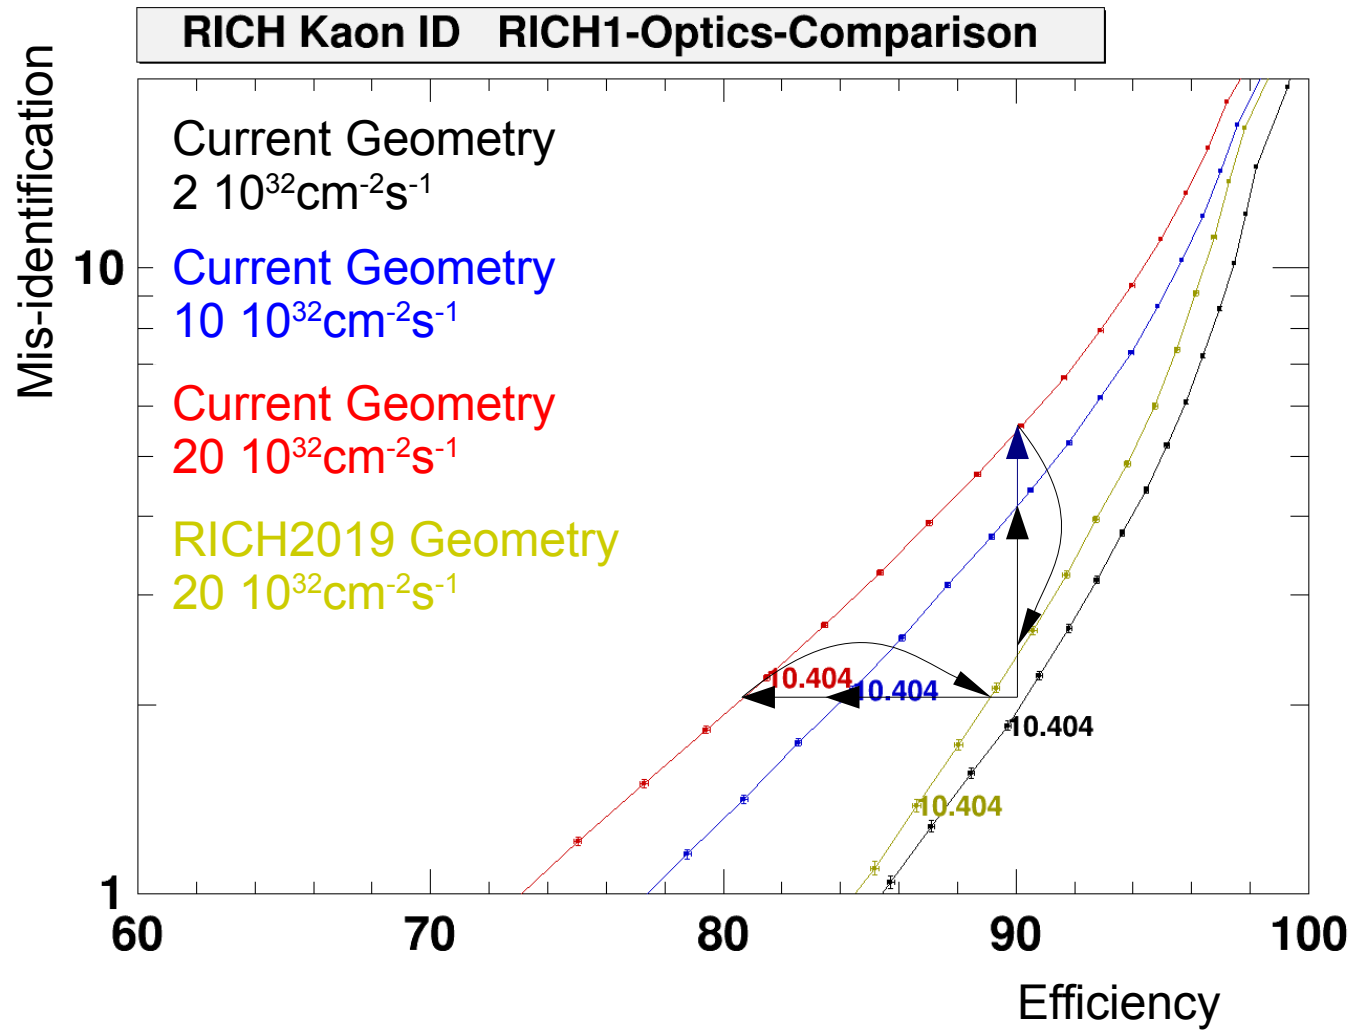

# RICH2019 concept: RICH1 optics

# RICH2019 simulated performance

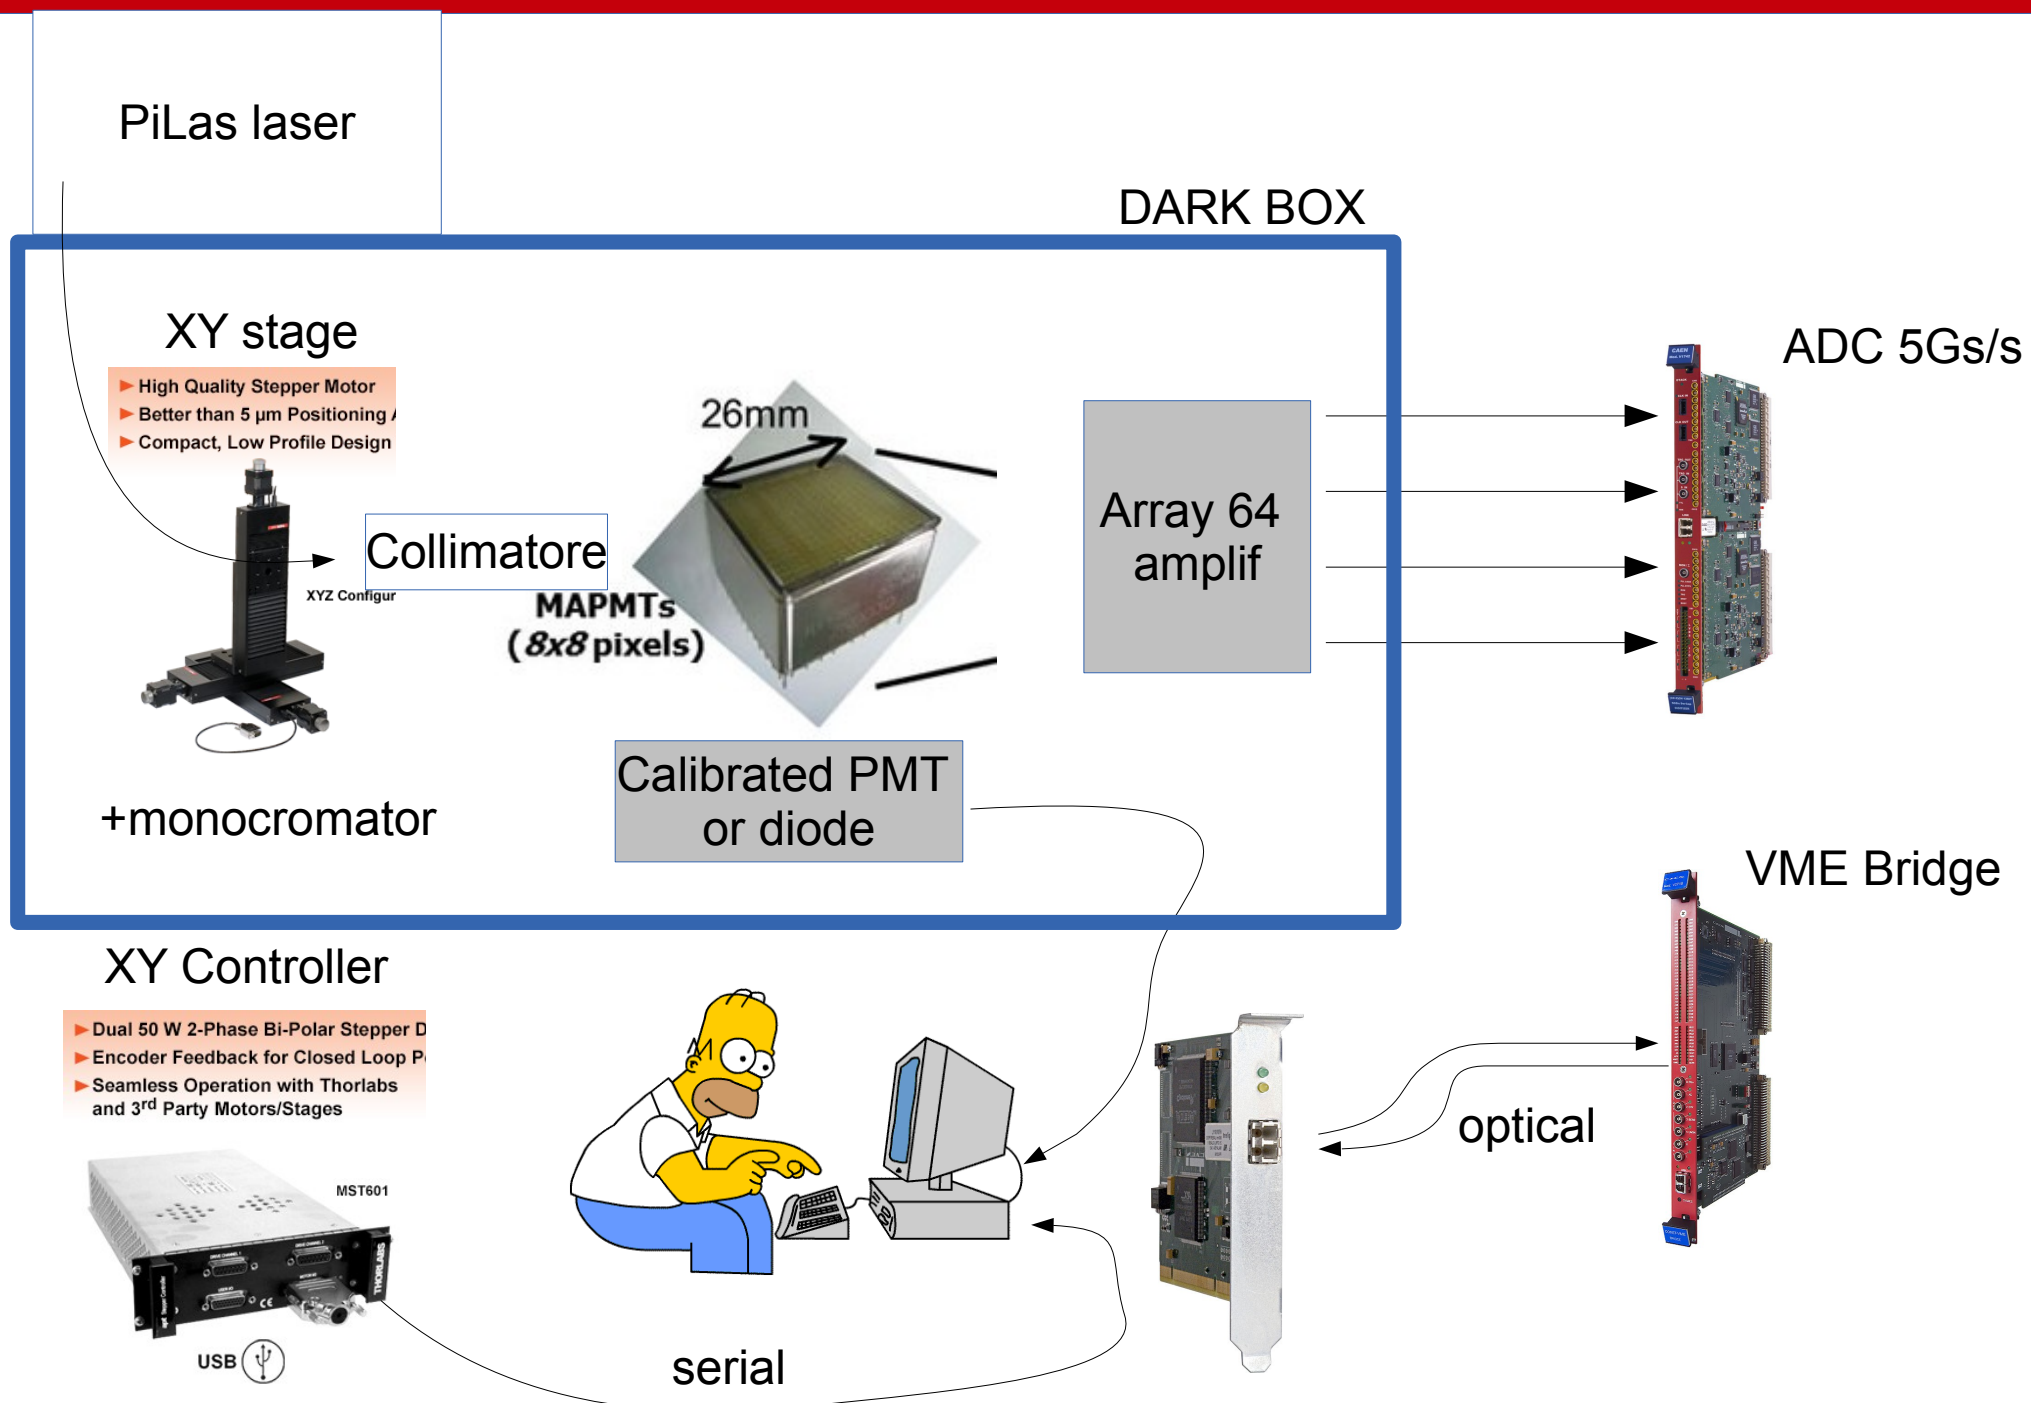

- Peak occupancy reduced from 35% to 25%

# MaPMT

- 2 types of 64 channel MaPMT: R11265 (1'x1'), H12700(2'x2')h
  - To reduce the cost at a modes reduction of performance
- R11265 was shown to be suitable for the RICH
- ~2000 MaPMT
- Padova [A. Bertolin, G. Simi] involved in the characterized and QA of the detectors before installation
  - Absolute Gain :to couple detectors in the same HV channel (margin to adjust gain to counter ageing)
  - Gain/Noise: to determine the efficiency of the 5sigma threshold
  - Effective area, QE: to determine absolute efficiency
  - Cross talk

# PMT test station

# Test station setup in progress

# Mechanical desing of elementary cell

- From conceptual design to engineering design

The Elementary Cell

Padova  
Genova  
Ferrara

Front-end board  
already produced

# General Mechanical Design

M. Benettoni  
Padova

Design suited for RICH2 but also for RICH1

Cable Routing

Cooling Support structure

Elementary Cell

# Thermal Simulation

## c) Semi-modules mounted on a cooling+support bar

Max Dtemp = 14°C on baseboard,  
with one cooling duct intermediate  
between digital chips

Max Dtemp = 9°C on baseboard,  
with two cooling ducts

# Production of first structures

- Forseen at the end of 2014/start of 2015
- Fabrication of support structures can be obtained by extrusion or by mechanical etching
  - The first structures will help decide about the most appropriate technology
- Thermal performance critical for ageing of PMT
  - Thermal performance will be verified on the first structures produced
- Test beam will also make use of the general mechanical design so mechanical structures need to be produced for it

# Requests 2015

- Costruzione Apparati
  - Meccanica generale RICH2:
    - 35KE per struttura meccanica generale e interfaccia con cella elementare
    - 15KE SJ al completamento del design dell'elettronica digitale
- Consumi:
  - 5KE per costruzione mockups meccanici
- Servizi
  - Progettazione meccanica
    - 40% M. Benettoni
    - 2 m.u. disegnatore
  - Officina meccanica
    - 6mu per costruzione mockups e prime strutture meccaniche
  - Officina elettronica
    - 1 mu per completamento costruzione PCB con amplificatori per stazione di test + supporto di F. Dal Corso
