

Foreman / Puppet

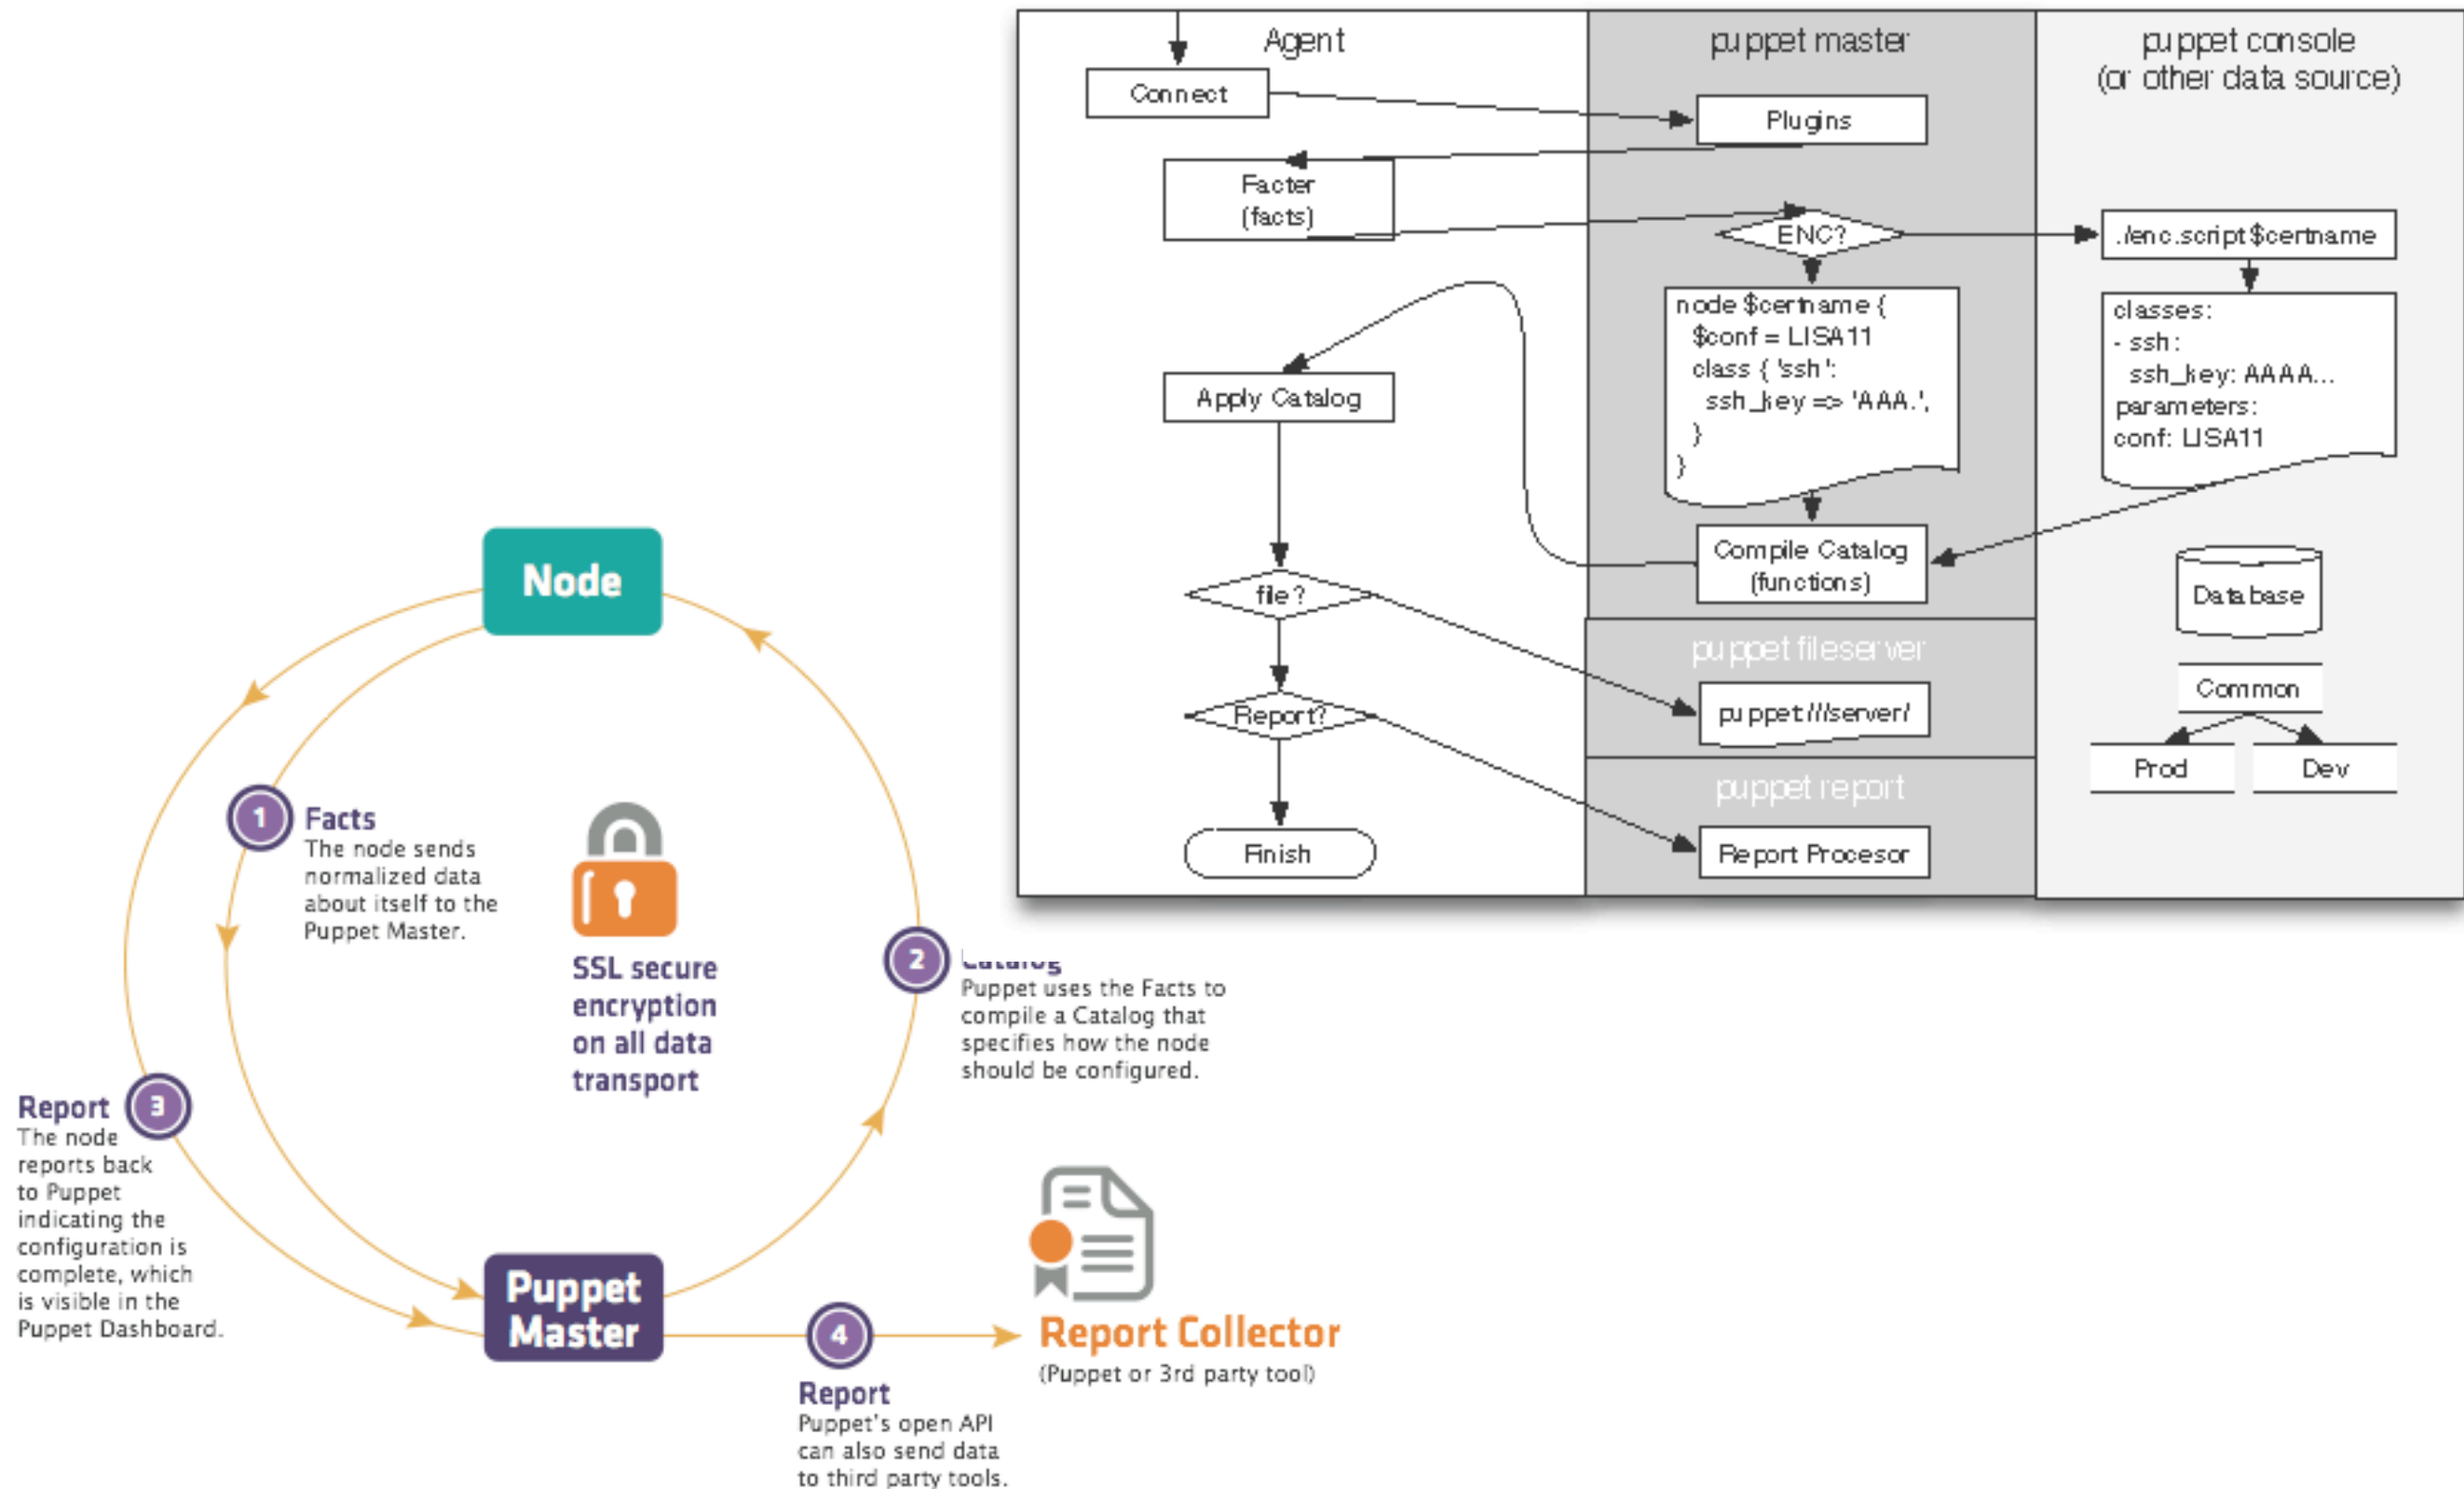

The Foreman

- **“Foreman is a complete lifecycle management tool for physical and virtual servers”**
 - <http://theforeman.org/>
- **Provisioning**
 - Provision on bare-metal & public or private clouds all from one place with one simple process
- **Configuration**
 - Configuration management solution including an ENC for Puppet, built-in support for parameterized classes and hierarchical parameter storage
 - Not yet integrated with Hiera
- **Monitoring**
 - Collect Puppet reports and facts. Monitor host configuration. Report status, distribution and trends

- **A configuration/managements system**
 - Based on Ruby classes
 - Hierarchical
 - Code hierarchy
 - Data and parameters hierarchy via Hiera
 - Inheritance
 - Templating (erb)
- **The configuration directives are stored in puppet classes or modules**
 - Modules are reusable, sharable units of Puppet code
 - Each module is build of one or more classes
 - Classes can be inherited by subclasses or implemented in other classes/modules
 - Modules and classes are store in the puppet masters and made available via secure web connections to the clients
- **Puppet is made of three distinct parts**
 - CA server
 - Server
 - May run standalone or via an appliation server like passenger
 - Client
- **External Nodes Classifiers can be connected to Puppet to deliver per-node configurations**
 - Foreman
 - Hiera
 - LDAP
 - ...

Puppet dataflow

The diagram illustrates the Foreman architecture. At the center is the **Foreman** component. It interacts with several external services and databases:

- Web User API**: A red box on the left with a red arrow pointing to Foreman.
- DB**: A blue cylinder at the bottom left connected to Foreman.
- LDAP / AD INTERNAL**: A blue cylinder at the bottom right connected to Foreman.
- Reports / Facts / ENC**: A green box to the right of Foreman, connected by a bidirectional arrow.
- Compute**: A green box below Reports / Facts / ENC, connected by a bidirectional arrow.
- RHEV-M, EC2, VMWare, OpenStack**: A blue cloud on the far right, connected to the Compute box.
- Restful API HTTP(s)**: A green box above Foreman, connected by a bidirectional arrow.
- Smart Proxy**: Four blue boxes at the top, each connected to Foreman by a bidirectional arrow. Each Smart Proxy box contains a list of services:
 - Smart Proxy 1: DNS, DHCP, TFTP, ...
 - Smart Proxy 2: ISC, DHCP, BMC
 - Smart Proxy 3: MS, DNS
 - Smart Proxy 4: Puppet, CA
- Puppet**: A purple box on the right, connected to the Smart Proxy 4 box.
- Segmented Network**: A green box on the left, connected to the Smart Proxy 1 box.

Foreman and Puppet

■ Foreman integrates with Puppet

- Via Smart Proxies
- Can run multiple instances of Puppet Masters for load balancing and failover (by default via Passenger)
- Acts as a full-featured ENC
- Hierarchical definition of hostgroups
- Managing of parametrized puppet classes
- Importing classes definition directly from the puppet master

■ Integration with other services via Smart Proxy

- TFTP
- DHCP
- DNS

■ Provisioning of OS for bare metal, plain VMs and Cloud facilities

■ REST APIs to interact via (authenticated) CLI

■ Plugins

Puppet resources

- **Many public domain puppet modules available from puppet forge**
 - <http://forge.puppetlabs.com>
 - Can be downloaded via the “puppet module” command
 - `puppet module install desalvo-frontier`
- **More code available from github**
 - <https://github.com/search?q=puppet&ref=cmdform>

Hands-On [1]

- **Create a new Foreman user for the tutorial**
- **Create a new Foreman HostGroup**
 - HG_<name>
- **Create a new project in OpenStack for the Tutorial**
 - Associate the users to the new project
- **Create the virtual router for the project**
 - Associate a new internal subnet for the project
 - Associate the external net
 - Allocate the floating ips
- **Create a new access key and import it to OpenStack**
 - `ssh-keygen -t rsa -f cloud.key`

Hands-On [2]

- **Create an Openstack Instance with CentOS 6.5**

- **Use the following User Data**

```
#cloud-config
ssh_pwauth: True
packages:
  - puppet
puppet:
  conf:
    main:
      ssldir: $vardir/ssl
  agent:
    pluginsync: true
    report: true
daemon: false
  ca_server: atlas-foreman.roma1.infn.it
  environment: production
  server: "atlas-foreman.roma1.infn.it"
  certname: "%f"
users:
  - name: <username>
    gecos: <full name>
    sudo: ALL=(ALL) NOPASSWD:ALL
    ssh-authorized-keys:
      - ssh-rsa <key>
```

- **Assign a floating IP to the new machine and login via the access key as the user you defined**
- **Assign the host to the HG_<name> group in Foreman**
- **Assign classes in foreman to the HG_<name> and run puppet interactively on the machine**
 - **sudo puppet agent -t**
