## A Cylindrical GEM Detector with Analog Readout for the BESIII Experiment

Wednesday, May 27, 2015 9:42 AM (0 minutes)

We are developing a cylindrical GEM detector with analog readout to upgrade the Inner Tracker of the BESIII experiment at IHEP (Beijing). The new detector will match the requirements for momentum resolution ( $\sigma_{pt}/Pt \sim 0.5\%$  at 1 GeV) and radial resolution ( $\sigma_{xy} \sim 100\mu\text{m}$ ) of the existing drift chamber and will improve significantly the spatial resolution along the beam direction ( $\sigma_z \sim 150\mu\text{m}$ ) with very small material budget (about 1% of  $X_0$ ). With respect to the state of the art the following innovations will be deployed: a lighter mechanical structure based on Rohacell, a new XV anode readout plane with jagged strip layout to reduce the parasitic capacitance, and the use of the analogue readout inside a high intensity magnetic field to have good spatial resolution without increasing the number of channels.

A beam test has been performed at CERN in order to measure the performance of a BESIII GEM prototype in a magnetic field up to 1 Tesla. An overview of the project and the preliminary results of the test along with a comparison with detailed Garfield simulations will be presented in the talk.

The project has been recognised as a Significant Research Project within the Executive Programme for Scientific and Technological Cooperation between Italy and P.R.C. for the years 2013-2015, and more recently has been selected as one of the project funded by the European Commission within the call H2020-MSCA-RISE-2014.

### Collaboration

on behalf of the BESIII CGEM group

**Primary author:** CIBINETTO, Gianluigi (FE)

**Presenter:** MAGGIORA, Marco (TO)

**Session Classification:** Gas Detectors - Poster Session

**Track Classification:** S7 - Gas detectors
