

IFR GEANT 4 SIMULATION

G. CIBINETTO AND M. MUNERATO

FRASCATI, 16 DECEMBER 2008

OUTLINE

- **The IFR description:**
 - basics and features
- **Improvements since the Elba meeting**
- **Open issues**
 - Background simulation
 - Technicalities
 - Detector Geometry

IFR G4 SIMULATION: IN A NUTSHELL

- **Who:** M. Andreotti, G. Cibinetto, M. Munerato, M. Rotondo.
- **Where:** Ferrara and Padova
- **What:** make a GDML description of the IFR, flexible enough to produce and test some different configurations.
- **Why:** use this description for the background events generation. Needed to understand background distribution on the detector for design and optimization.

IFR G4 SIMULATION

FEATURES

- The super B IFR is designed starting from the BaBar IFR, using the same iron structure and adding 8 active scintillator layers.

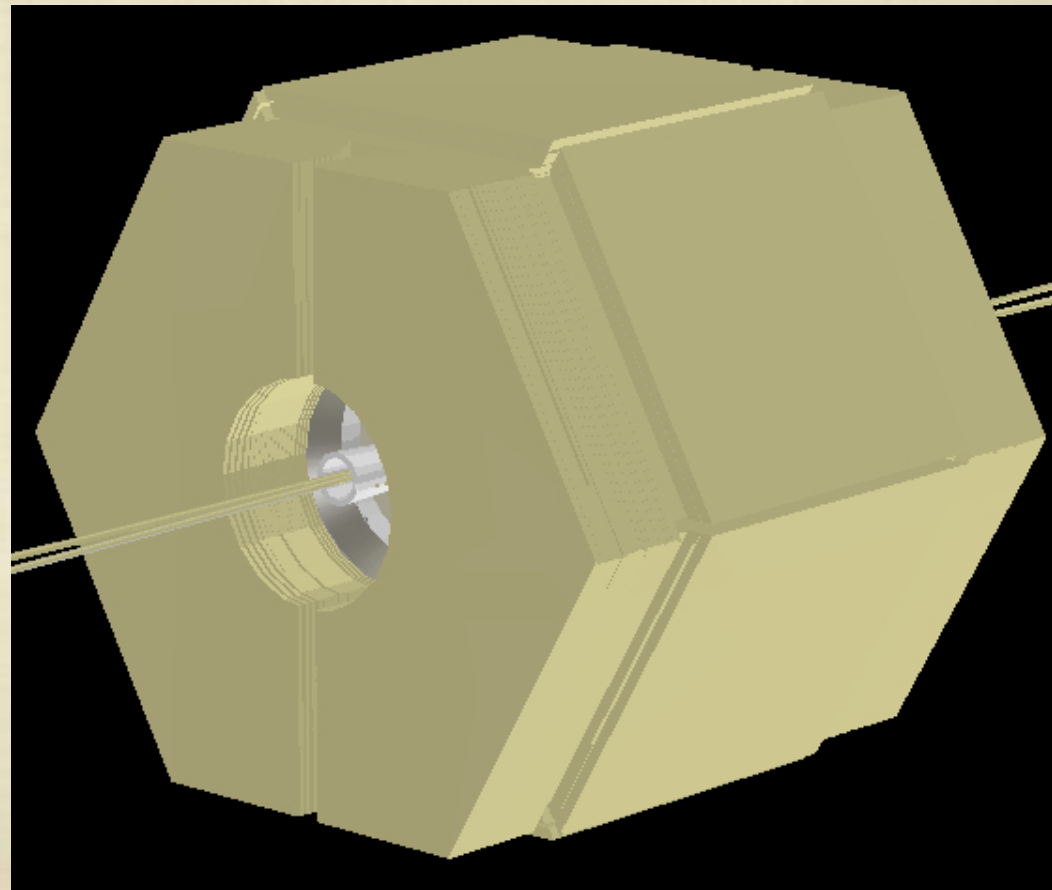

No transverse segmentation inside the active layers (just one big scintillator slab)

SETUP IMPROVEMENT

- At the Elba meeting the endcaps where misplaced.

- This has been fixed by updating our framework and fixing some Bruno bugs.

Thanks to Mauro Munerato
and Eugenio Paoloni

DESCRIPTION

IMPROVEMENTS (I)

DESCRIPTION

IMPROVEMENTS (II)

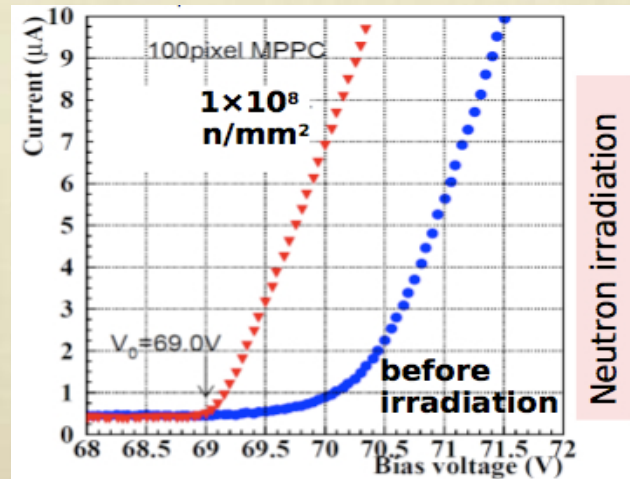

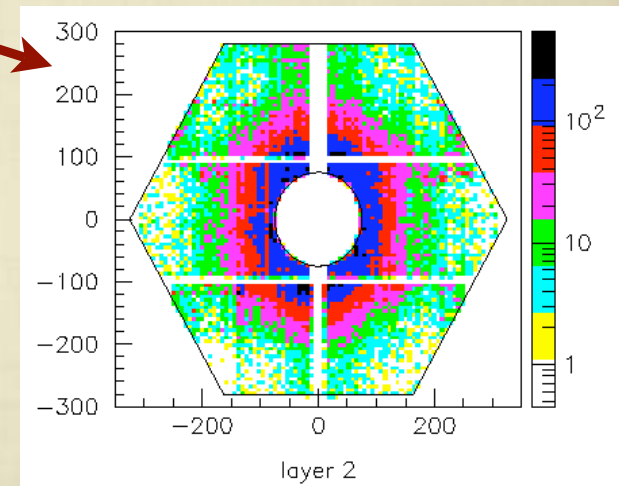

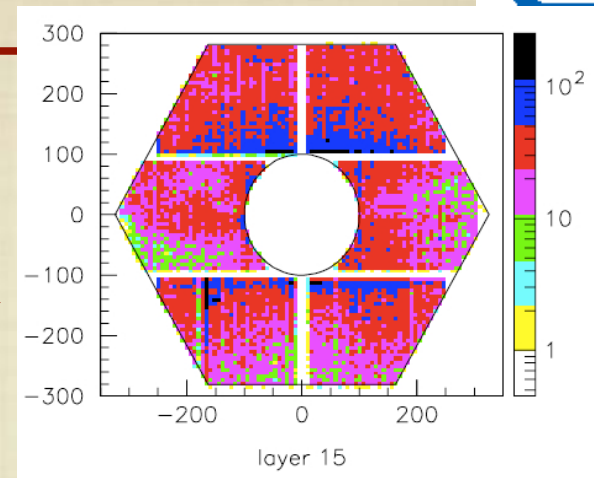

MAIN BACKGROUND ISSUES

■ Based on the Babar experience

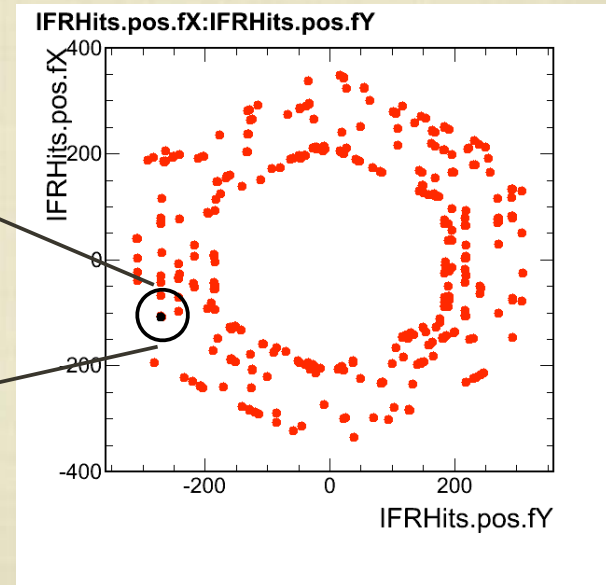

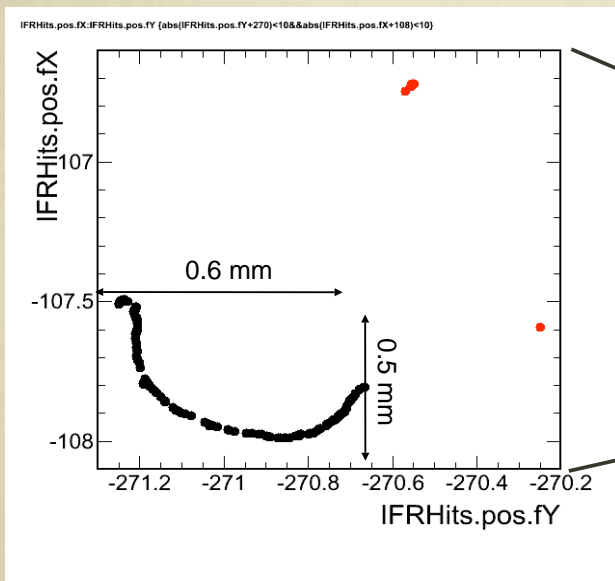

- Beam halo
- Innermost layers around the beam pipe
- Neutrons

TECHNICAL ISSUES

- We need a different granularity to extract useful quantities from the background rootuples.
- Hits info by layer is the option that has been proposed at the Elba meeting.

More than 150 ghits will be reduced to just one.

- A remote machine with the proper configuration will be also appreciated

DETECTOR GEOMETRY ISSUES

- How to adapt the BaBar IFR to the CDR design:
 - need of extra iron, iron vs brass, number of active layers, ...
 - Need of belt chambers.

SUMMARY

- Now
 - Need to know the neutron rate distribution (Background group).
 - Different rootuple structure (Background group) .
 - Study background distribution on the detector (IFR group).
- Short term (few months)
 - Beam halo simulation (Background group).
 - Need of extra iron and number of active layers (Fast Simulation and DGWG)
 - Detector optimization studies (IFR group).
- Medium term (less than one year)
 - Improve IFR description based on the optimization results (IFR group).
- Long term
 - Fine detector optimization
 -
