www.nic2014.org

outline

- Motivations
- New measurements:
 - $^{25}\text{Mg}(n, \gamma)$ @ n_TOF 
 - $^{25}\text{Mg}(n, \text{tot})$ @ GELINA 
- Preliminary results
- An idea for the future
 - $^{25}\text{Mg}(n, \alpha)^{22}\text{Ne}$ @ EAR2 - n_TOF

The s process

nucleosynthesis of heavy elements

E. M. Burbidge, G.R. Burbidge, W.A. Fowler, F. Hoyle
 Rev. Mod. Phys. **29** (1957) 547

The s process

Identified neutron sources:

and 2 different components:

1. Main component

→ AGB stars

$^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ partially activated

2. Weak component

→ Massive stars

$^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ main source

F. Käppeler, R. Gallino, S. Bisterzo, and Wako Aoki, *Rev. Mod. Phys.* **83** (2011) 157

M. Pignatari, R. Gallino, M. Heil, M. Wiescher, F. Käppeler, F. Herwig, S. Bisterzo, *ApJ.* **710** (2010) 155

Motivations

1. NEUTRON POISON:

$^{25,26}\text{Mg}$ are the most important **neutron poisons** due to neutron capture on Mg stable isotopes in competition with neutron capture on ^{56}Fe (the basic s-process seed for the production of heavy isotopes).

2. CONSTRAINTS for $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$:

It is one of the most important **neutron source in Red Giant stars**. Its **reaction rate** is very **uncertain** because of the **poorly known property of the states in ^{26}Mg** . From neutron measurements the J^π of ^{26}Mg states can be deduced.

$^{25}\text{Mg}(n, \gamma)$

Motivation 1

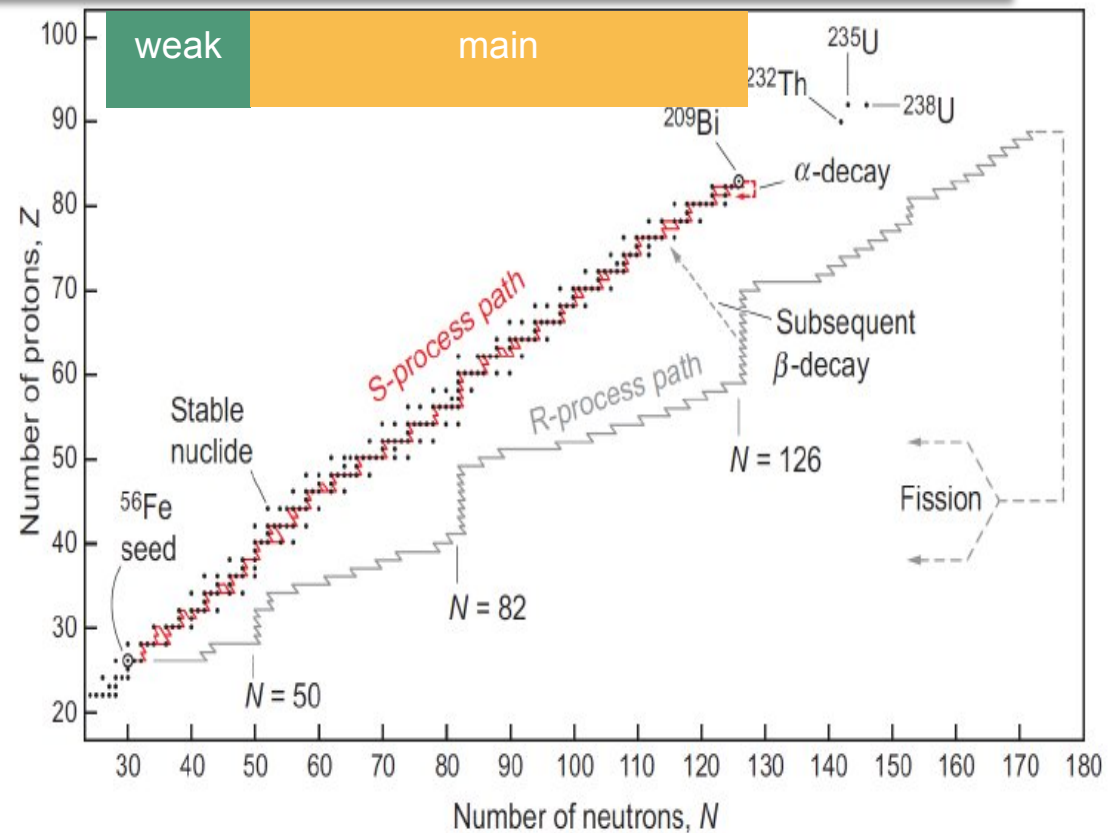

$^{25,26}\text{Mg}$ isotopes: neutron poison of the s process

Main component - AGB stars

- $kT = 8 \text{ keV}$ ($t = 10^4 \text{ years}$)
 - Mg density = 0
 - Neutron density $\approx 10^7 / \text{cm}^3$
- $kT = 23 \text{ keV}$ ($t < 10 \text{ years}$)
 - Mg density $\approx 10^{9-10} / \text{cm}^3$
 - Neutron density $\approx 10^{9-10} / \text{cm}^3$

Weak component - Massive stars

- $kT = 25 \text{ keV}$
 - Mg density $\approx 10^7 / \text{cm}^3$
 - Neutron density $\approx 10^7 / \text{cm}^3$
- $kT=90 \text{ keV}$
 - Mg density $\approx 10^{11-12} / \text{cm}^3$
 - Neutron density $\approx 10^{11-12} / \text{cm}^3$

$^{25}\text{Mg}(n, \gamma)$

Motivation 1

$^{25,26}\text{Mg}$ isotopes: neutron poison of the s process

Main component - AGB stars

- $kT = 8 \text{ keV}$ ($t = 10^4 \text{ years}$)
 - Mg density = 0
 - Neutron density $\approx 10^7 / \text{cm}^3$
- $kT = 23 \text{ keV}$ ($t < 10 \text{ years}$)
 - Mg density $\approx 10^{9-10} / \text{cm}^3$
 - Neutron density $\approx 10^{9-10} / \text{cm}^3$

Weak component - Massive stars

- $kT = 25 \text{ keV}$
 - Mg density $\approx 10^7 / \text{cm}^3$
 - Neutron density $\approx 10^7 / \text{cm}^3$
- $kT=90 \text{ keV}$
 - Mg density $\approx 10^{11-12} / \text{cm}^3$
 - Neutron density $\approx 10^{11-12} / \text{cm}^3$

From neutron TOF measurements:
→ $^{25}\text{Mg}(n, \gamma)$ cross section

Constraints for the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

Element	Spin/ parity
^{22}Ne	0^+
^4He	0^+

Only **natural-parity states** in ^{26}Mg can participate in the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

Constraints for the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

Element	Spin/ parity
^{22}Ne	0^+
^4He	0^+

Only **natural-parity** states in ^{26}Mg can participate in the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

$$\vec{J} = \vec{I} + \vec{i} + \vec{\ell}$$

$$\vec{J} = \vec{0} + \vec{\ell}$$

$$\pi = (-1)^\ell$$

$$J^\pi = 0^+, 1^-, 2^+, 3^-, 4^+ \dots$$

$^{25}\text{Mg}(n, \text{tot})$
 $^{25}\text{Mg}(n, \gamma)$

Motivation 2

Constraints for the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

Element	Spin/parity
^{25}Mg	$5/2^+$
neutron	$1/2^+$

$$\vec{J} = \vec{I} + \vec{i} + \vec{\ell}$$

$$\vec{J} = 2 + \vec{\ell} \quad \vec{J} = 3 + \vec{\ell}$$

s-wave $\rightarrow J^\pi = \underline{2}^+, 3^+$

p-wave $\rightarrow J^\pi = \underline{1}^-, 2^-, \underline{3}^-, 4^-$

d-wave $\rightarrow J^\pi = \underline{0}^+, 1^+, \underline{2}^+, 3^+, \underline{4}^+, 5^+$

States in ^{26}Mg populated by $^{25}\text{Mg}+n$ reaction

$^{25}\text{Mg}(n, \text{tot})$
 $^{25}\text{Mg}(n, \gamma)$

Motivation 2

Constraints for the $^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$ reaction

Element	Spin/parity
^{25}Mg	$5/2^+$
neutron	$1/2^+$
^{22}Ne	0^+
^4He	0^+

From neutron TOF measurements:
 $\rightarrow J^\pi$ for the ^{26}Mg states

$^{25}\text{Mg}(n, \gamma)$
@ n_TOF

Motivations

Results from previous (2003) measurement:

**Oxide Sample → Large uncertainty
in the mass of the Mg sample**

Motivations

New measurement: improvements

1. Sample

- Capture on a **metal** ^{25}Mg -enriched sample → **no data in literature**
- Transmission on the ^{25}Mg -enriched sample → **no data in literature**

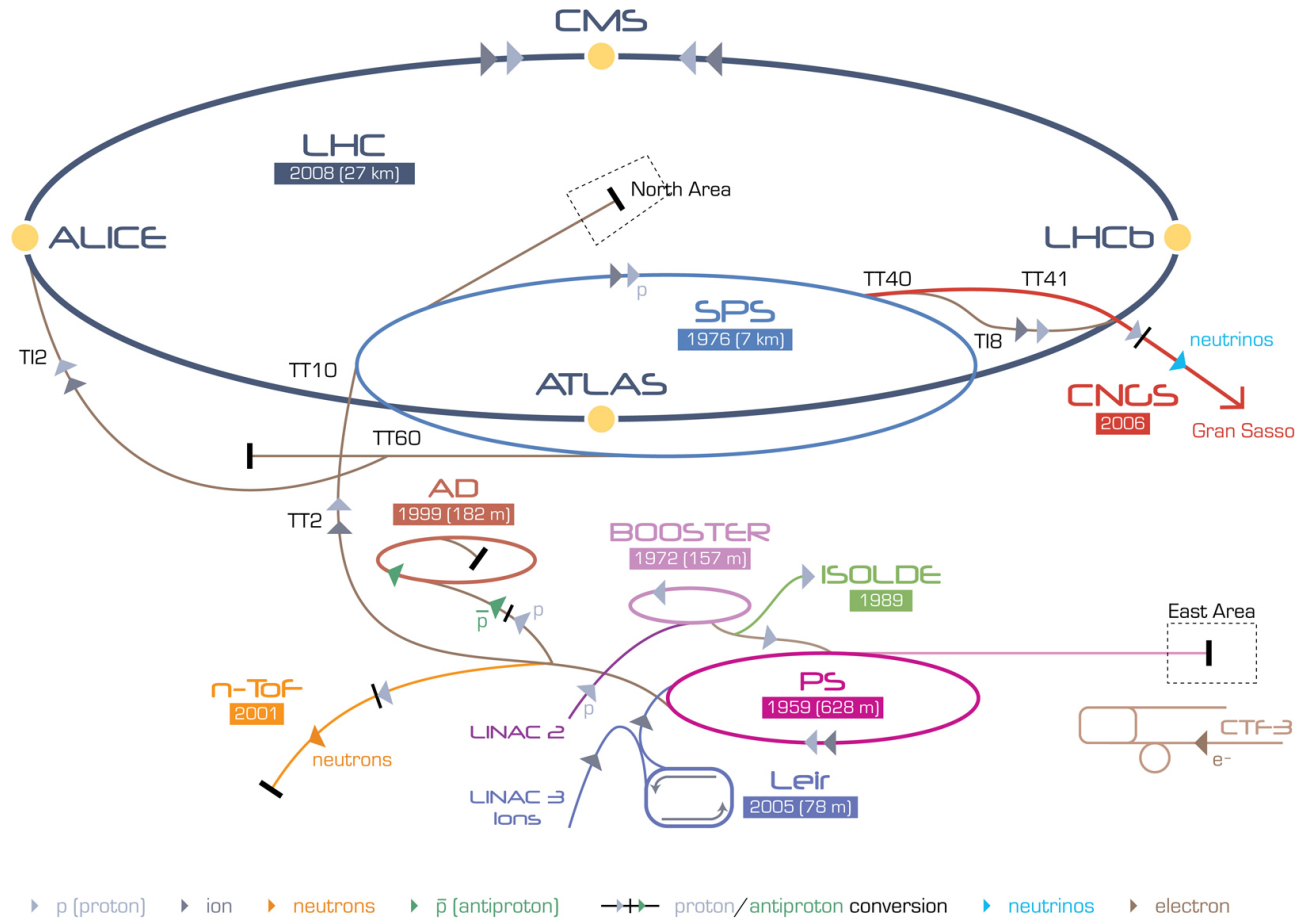

2. n_TOF facility Phase-II:

- **Borated water** as neutron moderator → **γ -ray background reduced**

@ n_TOF

New Measurement

2003

OLD sample (powder)

Science-Technical Centre "Stable Isotopes" (Obninsk, Russia)

Property	Value
Mass MgO	3.19 g
Diameter	22 mm
Thickness	2.3 mm
Areal density	1.234×10^{-2} at/b

Enrichment 95.75%

$^{24}\text{Mg} \sim 3\%$,

$^{26}\text{Mg} \sim 1.2\%$

**Neutrons $\approx 1.1 \times 10^{10}$
 $1 \text{ eV} < E_n < 1 \text{ MeV}$**

2012

New sample (metal)

National Isotope Development Center (ORNL, USA)

Property	Value
Mass Mg	3.94 g
Diameter	20 mm
Thickness	7 mm
Areal density	3.00×10^{-2} at/b

Enrichment 97.86 %

$^{24}\text{Mg} \sim 1.83 \%$

$^{26}\text{Mg} \sim 0.31 \%$

**Neutrons $\approx 1.9 \times 10^{10}$
 $0.03 \text{ eV} < E_n < 1 \text{ MeV}$**

Conclusion

- $^{25}\text{Mg}(n, \gamma)$ reaction cross-section was measured at n_TOF in 2003 and in 2012 with an improved measurement set up.
- The $^{25}\text{Mg}(n, \text{tot})$ measurement was performed at the GELINA facility in 2013.
- Final analysis - simultaneous resonance shape analysis of capture and transmission - is ongoing:
 - accurate $^{25}\text{Mg}(n, \gamma)$ cross section \approx confirms previous n_TOF data;
 - J^π information on $^{26}\text{Mg} \rightarrow$ evidence for more natural states than previously thought \rightarrow **HIGHER $^{22}\text{Ne}(\alpha, n)$ reaction rate;**
- An idea for the future: $^{25}\text{Mg}(n, \alpha)^{22}\text{Ne}$ at n_TOF EAR2, **to complete the study of the key isotope ^{25}Mg**

An idea for the future

Complete the study of the most important neutron source in Red Giants by measuring $^{25}\text{Mg}(n, \alpha)^{22}\text{Ne}$ reaction cross-section

An idea for the future

Complete the study of the most important neutron source in Red Giants by measuring $^{25}\text{Mg}(n, \alpha)^{22}\text{Ne}$ reaction cross-section

Challenge:

A. Cross section very small

B. Q-value 480 keV (\rightarrow thin sample)

A. + B. = Extremely low count rate expected

An idea for the future

Complete the study of the most important neutron source in Red Giants by measuring $^{25}\text{Mg}(n, \alpha)^{22}\text{Ne}$ reaction **cross-section**

Challenge:

- A. Cross section very small
- B. Q-value 480 keV (\rightarrow thin sample)

A. + B. = Extremely low count rate expected

Solution:

- a) High neutron flux
- b) Flux delivered in a short time interval

a) + b) = n_TOF new experimental area (**EAR2**) 

CERN n_TOF - EAR2

Neutron beam dump

EAR2 bunker
20 m from Target

Collimator

Permanent magnet

Existing shaft

Spallation Target

Commissioning starts in 2 weeks !

**EXAMPLE
Of SPIN
ASSIGNMENT**

Transmission : $\sigma(n, \text{tot})$

$$T \equiv e^{-n \sigma_{\text{tot}}}$$

T : transmission
Fraction of the neutron beam traversing the sample without any interaction

Reaction yield : $\sigma(n, r)$

$$Y_r \equiv (1 - e^{-n \sigma_{\text{tot}}}) \frac{\sigma_r}{\sigma_{\text{tot}}}$$

Y_r : reaction yield
Fraction of the neutron beam creating a (n,r) reaction in the sample

Time reversal invariance

Relation between the $^{25}\text{Mg}(n,a)^{22}\text{Ne}$ and the $^{22}\text{Ne}(a,n)^{25}\text{Mg}$ cross-section by “*detailed balance technique*”

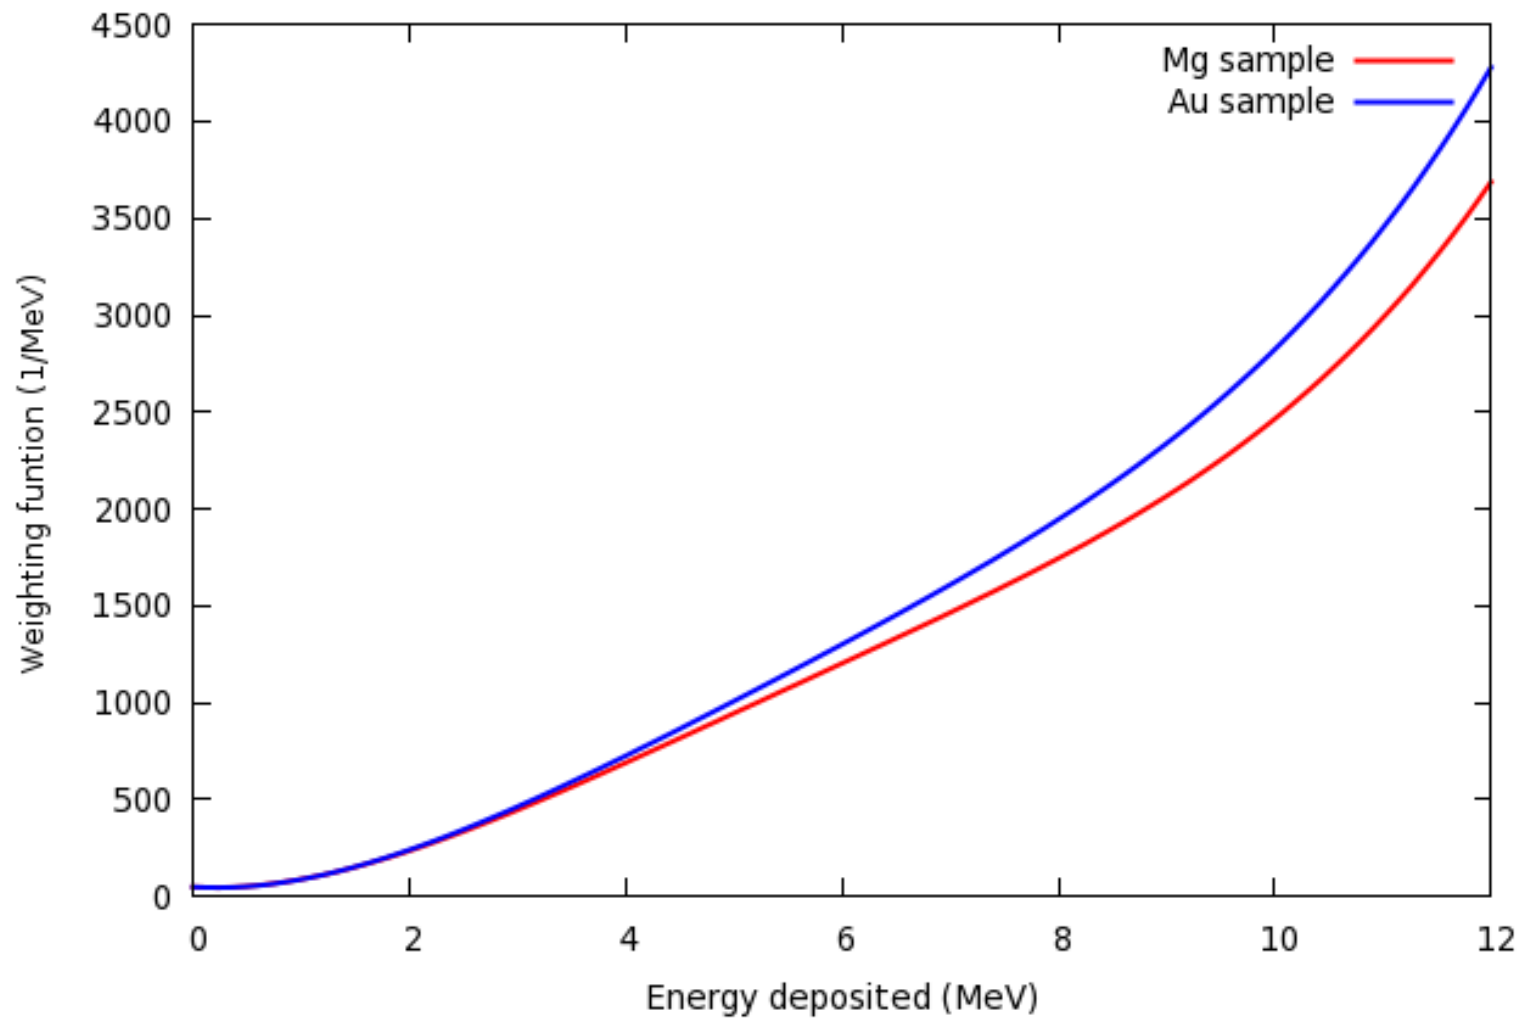

$$\frac{\sigma_{(a,b)}}{\sigma_{(b,a)}} = \frac{m_b m_B E_{bB} (2J_b + 1)(2J_B + 1)}{m_a m_A E_{aA} (2J_a + 1)(2J_A + 1)}$$

Energy region of interest:

$$0 < E_n < \text{few MeV}$$

Comparison of the Neutron Fluence in EAR1 and EAR2

Higher fluence₁
by a factor of 25, relative
to EAR1.

The **shorter flight
path** implies a factor of
10 smaller time-of-flight.

Global gain by a factor of
**250 in the signal/
background ratio**
