# The time-of-flight technique

$$tof = t_{\text{reaction}} - t_{\text{production}} \longrightarrow v = L / tof$$

$$E_n = mc^2 (\gamma - 1) \quad \text{with} \quad \gamma = \frac{1}{\sqrt{1 - v^2 / c^2}}$$

# The time-of-flight technique

- Excitation Energy:  $E_c = \sum E_\gamma = E_n + S_n$

- detection of full  $\gamma$  cascade**

$$\varepsilon_c \sim 100\%$$

$4\pi$  detector array

- detection of single  $\gamma$ 's**

e.g. apply pulse height weighting technique:

pulse height dependent weight on signals to achieve

$$\varepsilon_\gamma = k * E_\gamma$$

so that:  $\varepsilon_c = k * (E_n + S_n)$

# Detectors for capture reactions

Capture reactions are measured by detecting  $\gamma$ -rays emitted in the de-excitation process.

At n\_TOF, two detection systems are used, for different purposes.

## Total Absorption Calorimeter (TAC)

- High-efficiency  $4\pi$  detector (40  $\text{BaF}_2$  scintillators with neutron shielding)
- mostly used for fissile isotopes (actinides)

## $\text{C}_6\text{D}_6$ (deuterated liquid scintillators)

- low neutron sensitivity device
- used for low cross-section samples

# (n, $\gamma$ ) Total energy detection @ n\_TOF

## Improvements in the Experimental Setup & Data Analysis

- Lowest neutron sensitivity  $\Rightarrow$  No neutron background corrections !

R. Plag et al., Nucl. Instr. & Methods A, 496 (2003) 425

# (n, $\gamma$ ) Total energy detection @ n\_TOF

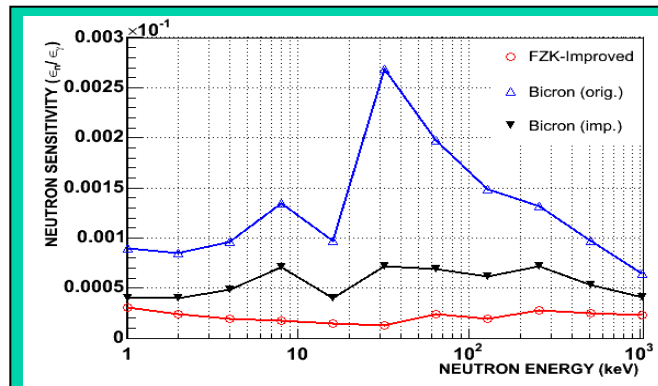

## Improvements in the Experimental Setup & Data Analysis

- Lowest neutron sensitivity  $\Rightarrow$  No neutron background corrections !

(n,n)

(n, $\gamma$ )

- n\_TOF: first facility with a neutron sensitivity optimized below measurable levels.
- All the (n, $\gamma$ ) measurements with  $C_6D_6$  (since start in 2002) were made with this improved setup.

# The experimental results: $^{151}\text{Sm}$

The branching ratio for  $^{151}\text{Sm}$  depends on:

- **Thermodynamical condition** of the stellar site (temperature, neutron density, etc...)
- Cross-section of  $^{151}\text{Sm}(n,\gamma)$

$^{151}\text{Sm}$  used as **stellar thermometer** !!

# The experimental results: $^{151}\text{Sm}$

Measured for the first time at a time-of-flight facility  
Resonance analysis with SAMMY code.

**Maxwellian averaged cross-section  
experimentally determined for the first time**

**s-process in AGB stars  
produces 77% of  $^{152}\text{Gd}$ ,  
23% from p process**

**Maxwellian averaged (n, $\gamma$ ) cross section of the  
 $^{151}\text{Sm}$  and previous calculation (symbol)**

**NO PREVIOUS MEASUREMENTS!**

# The experimental results: $^{63}\text{Ni}$

$^{63}\text{Ni}$  ( $t_{1/2}=100$  y) represents the **first branching point** in the s-process, and determines the **abundance** of  $^{63,65}\text{Cu}$

$^{62}\text{Ni}$  sample (1g) irradiated **in thermal reactor** (1984 and 1992), leading to enrichment in  $^{63}\text{Ni}$  of **~13 %** (131 mg)

In 2011 ~**15.4 mg**  $^{63}\text{Cu}$  in the sample (from  $^{63}\text{Ni}$  decay).

After **chemical** separation at PSI,  $^{63}\text{Cu}$  contamination <**0.01 mg**

**First high-resolution** measurement of  $^{63}\text{Ni}(n,\gamma)$  in the astrophysical energy range.

# The second **Experimental AR**ea @ n\_TOF

# n\_TOF Experimental Area 2

**Experimental Area 2 (EAR2)** is placed (vertically) at **20m** from spallation target.

**Higher fluence**, by a factor of 30, relative to EAR1.

The **shorter flight path** implies a factor of 10 smaller time-of-flight.

Global gain by a factor of **300 in the signal/background ratio** for radioactive isotopes!

# n\_TOF Experimental Area 2

The facility is presently undergoing the **commissioning** phase, particularly in terms of **flux and background**.

A rich experimental program is foreseen in **EAR2**, with many measurements already approved by the ISOLDE and the NTOF Committee (INTC) at CERN.

# The neutron flux in EAR 2

**PRELIMINARY**

# The experimental program EAR 2

## The EAR2 will allow to:

- measure samples of **very small mass (<1 mg)**
- measure **short-lived radioisotopes** (down to a few years)
- collect data on a much **shorter time scale**
- **measure (n,charged particle) reactions with thin samples**

## Measurements in EAR2:

- **(n,p)** and **(n, $\alpha$ )** cross sections on  $^7\text{Be}$ ,  $^{25}\text{Mg}$ ,  $^{26}\text{Al}$
- **Fission** cross sections of the **short lived actinides**  $^{232}\text{U}$ ,  $^{238,241}\text{Pu}$  and  $^{244}\text{Cm}$
- **Capture** cross section of  $^{79}\text{Se}$ ,  $^{245}\text{Cm}$
- Cross section and angular distribution of fragments from  $^{232}\text{U}(n,f)$

## Status of the EAR2:

- **Construction finished** May-2014
- **First neutron beam** mid-June-2014
- **Commissioning** 2014
- **Physics start** in 2015

# AstroPhysics program EAR I & EAR II

# Conclusions

- There is need of **accurate new data** on neutron cross-section both for **astrophysics and advanced nuclear technology**.
- Since 2001, **n\_TOF@CERN** has provided an important contribution to the field, with an intense activity on **capture and fission measurements**.
- Several results of interest for **stellar nucleosynthesis** (Sm, Os, Zr, Ni, Fe, etc...).
- Important data on actinides, of interest for **nuclear waste transmutation**.
- To date, high resolution measurements performed in **EAR1** in optimal conditions (borated water moderator, Class-A experimental area, etc...).
- A second **experimental area at 20 m** for high flux measurements is actually in commissioning.
- The EAR2 (starting in 2015) will open **new perspectives** for frontier measurements on short-lived radionuclides.
