Bertolini, Musso, Papadimitriou, Raj hep-th/1509.03594

Outline through *keywords*

- Supersymmetry breaking at strong coupling
- non-SUSY vacua of cascading gauge theories
- Ward identities without UV fixed point
- Holography and the goldstino

Conclusion (*flash forward*)

- *General* derivation of **Ward identities** with non-trivial sources
- Insensitivity to the **IR**
- Vacua with **spontaneous** ~~SUSY~~ \Leftrightarrow \overline{D} -brane at the tip of the conifold
- Successful, **necessary** check for the existence of ~~SUSY~~ vacua in the **Klebanov-Strassler** cascading gauge theory

(super)symmetry breaking at strong coupling

Klebanov Witten hep-th/9905104

- Dynamical SUSY breaking \leftrightarrow hierarchy problem
- Chiral symmetry in QCD
- High T_c superconductors and strange metals
- ...

At **strongly coupling**, fields either responsible or resulting from symmetry breaking are typically **composite**

Goldstino at strong coupling

- Goldstone theorem ensures the presence of a **massless mode** in the spectrum
- **Spontaneously** broken **SUSY** leads to a massless fermion mode, the **Goldstino**
- The **Goldstino** appears (e.g.) in the 2-point correlator of the supercurrent. Its residue is proportional to the **SUSY** order parameter

$$\langle \partial^\mu S_{\mu\alpha} (\sigma^\nu \bar{S}_\nu)_\beta \rangle = 2 \epsilon_{\alpha\beta} \langle T \rangle$$

- **GOAL:** *Explicitly check the above framework in holography*

Two questions

- Is the solution gravitationally (meta)stable?
- Is the supergravity mode dual to the Goldstino present?

→ A positive answer to the first guarantees that the solution is describing an actual QFT vacuum

→ The second ensures that in such a vacuum **SUSY** is broken spontaneously

One answer

In QFT the two questions can be answered independently!

- Consider the **supercurrent** 2-pt function

$$\langle S_{\mu\alpha} \bar{S}_{\nu\dot{\beta}} \rangle$$

- The information regarding the **Goldstino** pole is encoded in the term implied (*upon integration*) by the **supersymmetry Ward identity**

$$\langle \partial^\mu S_{\mu\alpha}(x) \bar{S}_{\nu\dot{\beta}}(0) \rangle = -2 \sigma_{\alpha\dot{\beta}}^\mu \langle T_{\mu\nu} \rangle \delta^4(x)$$

- **Ward Identities** depend on **UV** data only
- **Vacuum stability** is an **IR** property

Need to break conformal symmetry

- **Lorentz invariant** theory and vacuum

$$T_{\mu\nu} \propto \eta_{\mu\nu}$$

- **Spontaneous SUSY** breaking only allowed when conformal symmetry is broken **explicitly**.

$$\cancel{T^\mu{}_\mu = 0}$$

- Chase for **SUSY**-preserving terms which break conformality **explicitly**

Klebanov-Strassler theory

Klebanov, Strassler hep-th/0007191

Gauge Group	$SU(N + M) \times SU(N)$
Global Symmetry	$SU(2) \times SU(2) \times U(1)_B \times Z_{2M}$
Bifundamental (Chiral) Matter	$A_i, B_k \ (i, k = 1, 2)$
Superpotential	$W = \lambda \text{tr}(A_i B_k A_j B_l) \epsilon^{ij} \epsilon^{kl}$

$M \neq 0 \Rightarrow$ conformal symmetry is broken

(for $M = 0$ we have the Klebanov-Witten model)

Klebanov, Witten hep-th/9807080

non-trivial running \Rightarrow cascade
(two nodes oppositely) (sequence of Seiberg duality)

Lack of a UV fixed point (*formally KW with infinite rank*)

Cascading theories from 5d supergravity

5d $\mathcal{N} = 2$ SUGRA from 10d type IIB SUGRA on $T^{1,1}$

Cassani Faedo hep-th/1008.0883

- $SU(2) \times SU(2) (\times U(1))$ truncation
 - UV asymptotic analysis only (up to z^4)
-

★ **KT solution** describes the UV of

$SU(N + M) \times SU(N)$ KS model $N = kM$ k integer

★ **SUSY deformed KT solution** describes the UV of

$SU(N + M) \times SU(N)$ KS model $N = kM - p$ $p \ll M$

Kachru, Pearson, Verlinde hep-th/0112197

$$p = \# \text{ of } \overline{D}\text{-branes}$$

$$\mathcal{O}_{\tilde{b}}$$

difference

$$\frac{1}{g_1^2} - \frac{1}{g_2^2}$$

Domain wall ansatz and SUSY solution

$$ds^2 = \frac{1}{z^2} \left(e^{2Y(z)} \eta_{\mu\nu} dx^\mu dx^\nu + e^{2X(z)} dz^2 \right) \quad \text{warped domain-wall geometry}$$

$$e^{2Y} = h^{\frac{1}{3}}(z) , \quad e^{2X} = h^{\frac{4}{3}}(z) , \quad e^{2U} = h^{\frac{5}{2}}(z)$$

$$b^\Phi(z) = -\frac{9}{2} g_s M \log(z/z_0)$$

KT solution

(here obtained in a 5d formalism)

$$\phi(z) = \log g_s , \quad V = 0$$

z_0 is a renormalization scale of the dual field theory

$$h(z) = \frac{27\pi}{4g_s} \left(g_s N + \frac{1}{4} a (g_s M)^2 - a (g_s M)^2 \log(z/z_0) \right)$$

$$a = 3/2\pi$$

2-parameter family of **SUSY** solutions

$$e^{2Y} = h^{\frac{1}{3}}(z) h_2^{\frac{1}{2}}(z) h_3^{\frac{1}{2}}(z) \quad , \quad e^{2X} = h^{\frac{4}{3}}(z) h_2^{\frac{1}{2}}(z)$$

$$e^{2U} = h^{\frac{5}{2}}(z) h_2^{\frac{3}{2}}(z) \quad , \quad e^{2V} = h_2^{-\frac{3}{2}}(z)$$

$$b^\Phi(z) = -\frac{9}{2}g_s M \log(z/z_0) + z^4 \left[\left(\frac{9\pi N}{4M} + \frac{99}{32}g_s M - \frac{27}{4}g_s M \log(z/z_0) \right) \mathcal{S} - \frac{9}{8}g_s M \varphi \right] + \mathcal{O}(z^8)$$

$$\phi(z) = \log g_s + z^4 (3\mathcal{S} \log(z/z_0) + \varphi) + \mathcal{O}(z^8)$$

$$h(z) = \frac{27\pi}{4g_s} \left(g_s N + \frac{1}{4}a(g_s M)^2 - a(g_s M)^2 \log(z/z_0) \right) + \frac{z^4}{g_s} \left[\left(\frac{54\pi g_s N}{64} + \frac{81}{4} \frac{13}{64} (g_s M)^2 - \frac{81}{16} (g_s M)^2 \log(z/z_0) \right) \mathcal{S} - \frac{81}{64} (g_s M)^2 \varphi \right] + \mathcal{O}(z^8)$$

$$h_2(z) = 1 + \frac{2}{3}\mathcal{S}z^4 + \mathcal{O}(z^8) \quad h_3(z) = 1 + \mathcal{O}(z^8)$$

We need to focus just on up to z^4 order, however the parameterization allows for a deeper solution

Comments on the solutions

\mathcal{S}

- Correct parameter associated to \bar{D} perturbation
- Determined by **IR** conditions
- Total mass proportional (only!) to it

φ

In the conformal case ($M = 0$) it corresponds to an independent fluctuation of the dilaton (*in spirit similar to dilaton driven confinement*)

Gubser hep-th/9902155; Kuperstein, Truijen, Van Riet hep-th/1411.3358

- KS and KT differ at order z^3 by terms proportional to the conifold deformation parameter ϵ
- ϵ terms dominate over z^4 ~~SUSY~~ terms, *however* it does not affect the ~~SUSY~~ pattern

Bena, Giecold, Grana, Halmagyi, Massai hep-th/1106.6165

1-point functions

Functional variation of the renormalized action w.r.t. a source at a time

$$\begin{aligned} \langle T^{\mu\nu} \rangle &= \frac{2}{\sqrt{-\tilde{\gamma}}} \frac{\partial S_{\text{ren}}}{\partial \tilde{\gamma}_{\mu\nu}} \Big|_{\phi, \tilde{b}^\Phi, \tilde{U}, \tilde{\Psi}^+, \zeta_\phi^-, \tilde{\zeta}_b^-, \tilde{\zeta}_U^-}, & \langle \bar{S}^{-\mu} \rangle &= \frac{-2i}{\sqrt{-\tilde{\gamma}}} \frac{\partial S_{\text{ren}}}{\partial \tilde{\Psi}_\mu^+} \Big|_{\tilde{\gamma}, \phi, \tilde{b}^\Phi, \tilde{U}, \zeta_\phi^-, \tilde{\zeta}_b^-, \tilde{\zeta}_U^-} \\ \langle \mathcal{O}_\phi \rangle &= \frac{1}{2\sqrt{-\tilde{\gamma}}} \frac{\partial S_{\text{ren}}}{\partial \phi} \Big|_{\tilde{\gamma}, \tilde{b}^\Phi, \tilde{U}, \tilde{\Psi}^+, \zeta_\phi^-, \tilde{\zeta}_b^-, \tilde{\zeta}_U^-}, & \langle \bar{\mathcal{O}}_{\zeta_\phi^+} \rangle &= \frac{1}{\sqrt{-\tilde{\gamma}}} \frac{i}{\sqrt{2}} \frac{\partial S_{\text{ren}}}{\partial \zeta_\phi^-} \Big|_{\tilde{\gamma}, \phi, \tilde{b}^\Phi, \tilde{U}, \tilde{\Psi}^+, \tilde{\zeta}_b^-, \tilde{\zeta}_U^-} \\ \langle \mathcal{O}_{\tilde{b}} \rangle &= \frac{1}{2\sqrt{-\tilde{\gamma}}} \frac{\partial S_{\text{ren}}}{\partial \tilde{b}^\Phi} \Big|_{\tilde{\gamma}, \phi, \tilde{U}, \tilde{\Psi}^+, \zeta_\phi^-, \tilde{\zeta}_b^-, \tilde{\zeta}_U^-}, & \langle \bar{\mathcal{O}}_{\tilde{\zeta}_b^+} \rangle &= \frac{1}{\sqrt{-\tilde{\gamma}}} \frac{i}{\sqrt{2}} \frac{\partial S_{\text{ren}}}{\partial \tilde{\zeta}_b^-} \Big|_{\tilde{\gamma}, \phi, \tilde{b}^\Phi, \tilde{U}, \tilde{\Psi}^+, \zeta_\phi^-, \tilde{\zeta}_U^-} \end{aligned}$$

$\tilde{\gamma}$ is the field theory metric

$$S_{\text{ren}} = S_{\text{reg}} + S_{\text{ct}}$$

corresponding (*upon Fourier transforming*) to the presence of a massless pole
whose residue is proportional to $\langle T \rangle$...

...THE GOLDSTINO!

Conclusion

- *General* derivation of **Ward identities** with non-trivial sources
- Insensitivity to the **IR**
- Vacua with **spontaneous** ~~SUSY~~ \Leftrightarrow \overline{D} -brane at the tip of the conifold
- Successful, **necessary** check for the existence of ~~SUSY~~ vacua in the **Klebanov-Strassler** cascading gauge theory

Outlook

- On with the program of holographic renormalization!
(higher-point functions, systematic derivation of counter-terms and relation with Hamilton-Jacobi formalism)
- Extension to ~~SUSY~~ deformation of full KS
- F vs. D breaking toy models
(D-term version of hep-th/1502.02631)
- **Induced fields** and derivation of **SUSY-respecting** counter-terms in generic setups
(e.g. renormalization of SUSY theories on curved manifolds)
- Bottom-up and effective field theories for strongly coupled Goldstones
(and Goldstinos!)

Thanks!

The SUGRA Model

$$S_b = \frac{1}{2\kappa^2} \int d^5x \sqrt{-g} [R - \mathcal{G}_{IJ}(\varphi) \partial_i \varphi^I \partial^i \varphi^J - \mathcal{V}(\varphi)]$$

$$\varphi^I = \begin{pmatrix} U \\ V \\ b^\Phi \\ \phi \end{pmatrix}, \quad \zeta^I = \begin{pmatrix} \zeta_U \\ \zeta_V \\ \zeta_b \\ \zeta_b^\Phi \end{pmatrix}, \quad \mathcal{G}_{IJ}(\varphi) = \begin{pmatrix} \frac{8}{15} & 0 & 0 & 0 \\ 0 & \frac{4}{5} & 0 & 0 \\ 0 & 0 & e^{-\frac{4}{5}(U+V)-\phi} & 0 \\ 0 & 0 & 0 & \frac{1}{2} \end{pmatrix}$$

$$\mathcal{W}(\varphi) = -\frac{9}{2}(3\pi N + M)e^{-\frac{4}{3}U} + 3e^{-\frac{4}{15}(2U-3V)} + 2e^{-\frac{2}{15}(4U+9V)}$$

$$\mathcal{V}(\varphi) = \mathcal{G}^{IJ} \partial_I \mathcal{W}(\varphi) \partial_J \mathcal{W}(\varphi) - \frac{4}{3} \mathcal{W}(\varphi)^2$$

★ **σ -model** description and **superpotential** → efficient account of the action and its **SUSY** structure

$$\text{(e.g.)} \quad \delta_\epsilon \zeta^I = -\frac{i}{2} (\not{\partial} \varphi^I - \mathcal{G}^{IJ} \partial_J \mathcal{W}) \epsilon$$

★ M and N **continuous** in **SUGRA** but **quantised** in **type IIB**

$$\frac{1}{4\pi^2 \alpha'} \int_{\mathbf{S}^3} F_3 = M \qquad \frac{1}{(4\pi^2 \alpha')^2} \int_{T^{1,1}} F_5 = N$$

SUSY field theories and string theory

- A large class of **SQFT** (*admitting **SUSY** vacua*) can be constructed in string theory
 - *e.g. quiver gauge theories arising from stacks of D-branes at Calabi-Yau singularities*
- Relying on the **holographic conjecture**, in the **decoupling limit** one can describe **SUSY** vacua by means of dual gravitational backgrounds (*further effort typically needed to acquire full control on **stability properties, dynamics and spectrum***)
- Kachru-Pearson-Verlinde proposal to put \bar{D} on the Klebanov-Strassler conifold
 - **Likely to be a mechanism with more general relevance (i.e. beyond the KS setting)**

Kachru, Pearson, Verlinde hep-th/0112197

Argurio, Bertolini, Franco, Kachru hep-th/0610212 hep-th/0703236

$U(1)$ breaking (*holographic toy model*)

Prototypical example of the occurrence of **Goldstone** bosons in holography:
5D vector with an axion-like scalar.

$$S = \int d^5x \sqrt{G} \left[\frac{1}{4} F^{MN} F_{MN} + \frac{1}{2} m(z)^2 (\partial_M \alpha - A_M)(\partial^M \alpha - A^M) \right]$$

$$\Phi = \frac{1}{\sqrt{2}} m e^{i\alpha}$$

Higgs mechanism for
the minimally-coupled Φ

Bianchi, Freedman, Skenderis hep-th/0105276
Argurio, Musso, Redigolo hep-th/1411.2658

$$A_M \rightarrow A_M + \partial_M \lambda \quad \alpha \rightarrow \alpha + \lambda$$

Gauge transformation

$$(\Delta_{\mathcal{O}_m} = 3) \quad m(z) = m_0 z + \tilde{m} z^3 + \dots$$

Bulk: a non-trivial profile for $m(z)$
breaks *spontaneously* the gauge
symmetry

EXPLICIT **SPONTANEOUS**

Boundary: the breaking of the global $U(1)$
depends on the details of the profile of $m(z)$

Spontaneous vs Explicit: *expectations*

The transverse and longitudinal parts of A_μ are **dual** respectively to the transverse and longitudinal parts of the boundary current J_μ

$$\langle J_\mu(k) J_\nu(-k) \rangle = -(k^2 \delta_{\mu\nu} - k_\mu k_\nu) C(k^2) - m_0^2 \frac{k_\mu k_\nu}{k^2} F(k^2)$$

The longitudinal part of A_μ mixes with α which is **dual** to the imaginary part of the operator breaking the symmetry, $\text{Im } \mathcal{O}_m$

$$\int d^4x \Phi_0 \mathcal{O}_m + c.c. = \sqrt{2} \int d^4x (m_0 \text{Re} \mathcal{O}_m - m_0 \alpha_0 \text{Im} \mathcal{O}_m)$$

- **SPONTANEOUS:** $F(k^2) = 0$ (*purely transverse*), massless pole in $C(k^2)$, massless pole in the correlator $\langle J_\mu(k) \text{Im} \mathcal{O}_m(-k) \rangle = \sqrt{2} \tilde{m}_2 (k_\mu/k^2)$
- **EXPLICIT:** $F(k^2) \neq 0$, no massless pole in $C(k^2)$, Ward identity

$$\partial_\mu J^\mu = m_0 \text{Im } \mathcal{O}_m$$

Spontaneous vs Explicit: *outcome*

SPONTANEOUS

$$S_{\text{ren}} = - \int d^4k \left[a_{0\mu}^t \tilde{a}_{2\mu}^t + \tilde{m}^2 \alpha_0 (\tilde{\alpha}_2 + a_0^l) + \text{local} \right]$$

- $\tilde{m}_2^2 \alpha_0 a_0^l$ term leads to $\langle \partial_\mu J^\mu \text{Im } \mathcal{O}_m \rangle \sim \tilde{m}_2$

$t \rightarrow$ transverse
$l \rightarrow$ longitudinal

EXPLICIT

$$S_{\text{ren}} = - \int d^4k \left[a_{0\mu}^t \tilde{a}_{2\mu}^t + m_0^2 (\alpha_0 - a_0^l) \tilde{\alpha}_2 + \text{local} \right]$$

- The Ward identity (coming from S_{ren}) depends only on the combination $\alpha_0 - a_0^l$ (*bulk gauge symmetry*)

The massless pole appears in $a_{0\mu}^t \tilde{a}_{2\mu}^t$ because of bulk dynamics and in the **explicit** case it cancels from the full correlator $\langle J_\mu J_\nu \rangle$ (and it could be canceled by local terms $\propto m_0^2$).

Lessons from the toy model

- In general the UV analysis **does not** commute with the zero-source limit
- When the breaking is **spontaneous** we have a **Goldstone** in $\langle J_\mu J_\nu \rangle$ (*which is transverse*) and in $\langle \text{Im}\mathcal{O}_m \text{Im}\mathcal{O}_m \rangle$ arising from bulk dynamics and insensitive to the UV details (*renormalization*)
- The **Goldstone** appears also in $\langle J_\mu(k) \text{Im}\mathcal{O}_m(-k) \rangle = \sqrt{2} \tilde{m}_2 (k_\mu/k^2)$ because the VEV of $\text{Re}\mathcal{O}_m \propto \tilde{m}_2$ produces a Schwinger term whose holographic manifestation depends **only** on the renormalization
- Same kind of reasoning (*modulo technicalities*) can be adopted for other symmetries, e.g. R-symmetry, conformal, ...

Computation of the T 1-point function

$$\langle T^{\mu\nu} \rangle = e^{\frac{4}{15}U} e^X \left(-2 (K \gamma^{\mu\nu} - K^{\mu\nu}) + \frac{2}{\sqrt{-\gamma}} \frac{\delta S_{\text{ct}}}{\delta \gamma_{\mu\nu}} \right)$$

$$K_{\mu\nu} = \frac{1}{2} \dot{\gamma}_{\mu\nu} = -\frac{1}{2} z e^{-X} \partial_z \left(\frac{e^{2Y}}{z^2} \right) \eta_{\mu\nu}$$

$$S_{\text{ct}} = - \int d^4x \sqrt{-\gamma} 2\mathcal{W}$$

$$\langle T_{\nu}^{\mu} \rangle = -2 \left[3z \partial_z \log \left(\frac{e^Y}{z} \right) + e^X \mathcal{W} \right] \delta_{\nu}^{\mu}$$
