Extraction of TMDs from experimental data

Thursday, 24 September 2015 09:00 (30 minutes)

I will review the current status of the extraction of Transverse Momentum Distributions (TMDs) from experimental data. We are gaining an ever increasing knowledge about TMDs, both unpolarized and polarized, but we are still far from a precise determination of these quantities. Central issues are currently related to the implementation of TMD evolution in the extractions. To make further progress, new experimental data are also needed.
