

The AdS/CFT duality

Thursday, 26 March 2015 10:15 (45 minutes)

The AdS/CFT duality brought the holographic principle to center stage in string theory. This correspondence relates theories of gravity on curved spaces to ordinary quantum field theories on the boundaries of those spaces. Due to its nature, it provides a tool for studying strongly interacting field theories, where perturbative methods are not applicable. In this talk I will discuss this duality and present some examples of its realisation.

Presenter: BISSI, Agnese (University of Oxford)

Session Classification: Quantum gravity
