CONGRESSO NAZIONALE
Roma, 21 - 25 settembre 2015

Physics Motivations

2

Open issues in HEP, related to flavour

- **Baryon asymmetry in cosmology:** new sources of CPV
- **Quark and lepton hierarchy (mass and flavour), 19 free parameters in SM:** GUTs (SUSY) ?
- **Dark Matter:** hidden dark sector ?
- **Finite neutrino masses:** (charged) lepton flavour violation (tau) ?

Search for new physics (NP)

- **Energy frontier:** direct production of new particles - limited by beam energy (LHC - ATLAS, CMS)

- **Intensity frontier:** new particles in virtual loops, deviation from SM expectations (B factories, LHCb)

If NP is found in direct searches it is reasonable to expect NP effects in B, D, τ decays

Physics Motivations

Belle II

- **Intensity frontier:** new particles in virtual loops, deviation from SM expectations (B factories, LHCb)

If NP is found in direct searches it is reasonable to expect NP effects in B, D, τ decays

SuperKEKB

4

- **Electron-positron collider** situated at KEK (Tsukuba, Japan), upgrade of KEKB
- **Construction completed in 2015**
- $e^+e^- \rightarrow B\bar{B}$ (4 GeV + 7 GeV) mainly at $\sqrt{s^{cm}}=10.58$ GeV ($\Upsilon(4S)$ resonance)

	E (GeV) LER/HER	β^*_y (mm) LER/HER	β^*_x (cm) LER/HER	ϕ (mrad)	I (A) LER/HER	L ($\text{cm}^{-2}\text{s}^{-1}$)
KEKB	3.5/8.0	5.9/5.9	120/120	11	1.6/1.2	2.1×10^{34}
SuperKEKB	4.0/7.0	0.27/0.30	3.2/2.5	41.5	3.6/2.6	80×10^{34}

reduced boost $\sim 40-50 \times$ factor 20 factor 2-3

Luminosity
$$L = \frac{\gamma_{\pm}}{2e r_e} \left(1 + \frac{\sigma_y^*}{\sigma_x^*} \right) \frac{I_{\pm} \xi_{y_{\pm}}}{\beta_{y_{\pm}}} \frac{R_L}{R_{\xi_y}}$$
beam current
vertical beta function at IP

Nano-beam scheme firstly proposed by P. Raimondi for SuperB

SuperKEKB

5

Peak instantaneous luminosity: $\sim 0.8 \times 10^{36} \text{ cm}^{-2} \text{ s}^{-1}$

Belle II overall integrated luminosity: $\sim 50 \text{ ab}^{-1}$
 corresponding to 55×10^9 BB pairs (BaBar + Belle
 $\sim 1.5 \text{ ab}^{-1}$)

SuperKEKB is the intensity frontier

40x higher instantaneous
 luminosity than KEKB

Higher beam background (10-20 x)

9/24/15

Belle II upgrade:

- **Extended VD region** (added pixel detector)
- **Extended Drift Chamber region**
- **New ECL electronics** (waveform sampling and fitting)
- **Better hermeticity** (adding PID and μ ID in the endcaps)
- **High efficiency KLM detector** (some RPCs layers substituted with scintillators)

- Better secondary vertex resolution
- Improved K/π separation and flavour tagging
- Increased K_s , π^0 and slow pion efficiency

Unique capabilities of e^+e^- B factories - Belle II

7

1. **Beam energy constraint** and adjusted for different resonances $\Upsilon(nS)$
2. **Clean experimental environment**, low track multiplicity and detector occupancy (w.r.t hadron collider)
 - high B, D, K, tau reconstruction efficiency
 - open trigger $\sim 99\%$ efficient
3. **Full reconstruction of one B (B_{tag})** constrains the 4-momentum of the other (B_{sig})
 - helpful in reconstruction of channels with missing energy
 - opposite side B tagging efficiency: $\sim 30\%$ ($\sim 2\%$ @LHCb)
4. **Excellent EM calorimetry performances**
 - high reconstruction efficiency of neutral final states

- CPV in B decays, CKM angles ($B \rightarrow J/\psi K^0, K^0 \pi^0 \gamma, K\pi$)
- (Semi)leptonic B decays, CKM sides ($B \rightarrow D^{(*)} l \nu, \pi l \nu, \tau \nu, \mu \nu$)
- Rare B decays ($B \rightarrow K \nu \nu, X_s \gamma, X_s l l, \gamma \gamma$)
- Charm physics ($D \rightarrow l \nu$, mixing, CPV)
- LFV tau decays ($\tau \rightarrow 3l, l \gamma$)
- Dark Sector, Spectroscopy

	Belle	BaBar	Global Fit CKMfitter	LHCb Run-2	Belle II 50 ab^{-1}	LHCb Upgrade 50 fb^{-1}	Theory
$\varphi_1: ccs$	0.9°		0.9°	0.6°	0.3°	0.3°	v. small.
$\varphi_2: uud$	4° (WA)		2.1°		1°		~1-2°
$\varphi_3: DK$	14°		3.8°	4°	1.5°	1°	negl.
$ V_{cb} $ inclusive	1.7%		2.4%		1.2%		
$ V_{cb} $ exclusive	2.2%				1.4%		
$ V_{ub} $ inclusive	7%		4.5%	7.2%	3.0%		
$ V_{ub} $ exclusive	8%				2.4%		
$ V_{ub} $ leptonic	14%				3.0%		

see backup for details on Belle2-LHCb comparison

Belle II – golden modes with 5 ab⁻¹

9

• B → τν

- Helicity suppressed. **BaBar and Belle found evidence.**

$\mathcal{B} = [0.91 \pm 0.19(\text{stat.}) \pm 0.11(\text{syst.})] \times 10^{-4}$ Belle combination ($\sim 4.6 \sigma$)

In agreement with SM expectations

Projections for B → lν(γ)

- **NP, e.g. charged Higgs, enhances the branching ratio.** The 2-Higgs doublet model predicts

$$B = B_{SM} \times \left(1 - m_B^2 \frac{\tan^2 \beta}{m_{H^\pm}^2} \right)$$

Belle II – golden modes with 5 ab⁻¹

10

• $B \rightarrow D^{(*)} \tau \nu$

- Measurement of $R^{(*)} = \text{BR}(B \rightarrow D^{(*)} \tau \nu) / \text{BR}(B \rightarrow D^{(*)} l \nu)$
- **BaBar**: 3.5 σ far from SM
- **LHCb**: consistent with SM
- **Belle**: consistent with both LHCb and BaBar

• $B \rightarrow X_u l \nu$

- Tension between inclusive and exclusive measurements of $|V_{ub}|$

Projections for LFV in backup slides

Belle II schedule: installation and commissioning

11

BEAST (Beam Exorcism for **A** **S**table experiment): commissioning detector, aimed at studying beam induced backgrounds near the IP

BEAST phase 1 (2016): beam, no collisions, cosmics

BEAST phase 2 (2017-2018): collisions, complete Belle II detector except for Vertex Detector

Full physics (end 2018-2024): full Belle II detector

Belle II: ~650 collaborators, 99 institutions, 23 regions/countries

Summary

12

- In the SuperKEKB B factory e^- and e^+ collisions will reach the unprecedented instantaneous luminosity of $\sim 10^{36} \text{cm}^{-2}\text{s}^{-1}$
- The upgraded Belle II detector will face the higher level of backgrounds with improved tracking and PID
- The detector commissioning is starting in 2016 with first collisions in 2017 and full physics program in 2018
- The physics program includes the CP violation, (semi)leptonic B decays, rare B decays, LFV, charm physics, dark sector and spectroscopy
- With the full dataset of 50 / ab collected by 2024 Belle II will be able to shed light on the physics beyond the standard model

Thanks !
