The pseudocritical line in QCD at nonvanishing chemical potential

Thursday, December 10, 2015 12:40 PM (20 minutes)

We present a determination of the curvature of the pseudo-critical line in $N_f=2+1$ QCD at the physical point, performed using the analytic continuation approach. We extrapolate the results towards the continuum limit by considering four different lattice spacings and studying the possible systematics involved.
