Electromagnetic and hadronic physics in Geant4

Luciano Pandola INFN – Laboratori Nazionali del Sud

Based on a presentation by G.A.P. Cirrone (INFN-LNS)

Outline

- The philosophy of the physics definition
- How to define and activate models
- Electromagnetic physics
- Hadronic physics

Philosophy

- Provide a general model framework that allows the implementation of complementary/alternative models to describe the same process (e.g. Compton scattering)
 - A given model could work better in a certain energy range
- Decouple modeling of cross sections and of final state generation
- Provide processes containing
 - <u>Many possible models</u> and cross sections
 - <u>Default cross sections</u> for each model

Models under continuous development

User Classes

Initialisation classes

Invoked at the initialization

G4VUserDetectorConstruction
 G4VUserPhysicsList

<u>Global</u>: only one instance of them exists in memory, shared by all threads (**readonly**). Managed only by the master thread.

Action classes

Invoked during the execution loop

G4VUserActionInitialization

- G4VUserPrimaryGeneratorAction
- G4UserRunAction (*)
- G4UserEventAction
- G4UserTrackingAction
- G4UserStackingAction
- G4UserSteppingAction

Local: an instance of each action class exists for each thread.

(*) Two RunAction's allowed: one for master and one for threads

G4VUserPhysicsList

- All physics lists **must** derive from this class
 - And then be registered to the G4(MT)RunManager
 - Mandatory class in Geant4

```
class MyPhysicsList: public G4VUserPhysicsList {
  public:
  MyPhysicsList();
  ~MyPhysicsList();
  void ConstructParticle();
  void ConstructProcess();
  void SetCuts();
 }
```

- User must implement the following (purely virtual) methods:
 - ConstructParticle(), ConstructProcess(), SetCuts()

ConstructParticle()

- Choose the particles you need in your simulation and define all of them here
 - G4Electron::ElectronDefinition()
 - G4Gamma::GammaDefinition()
 - ••••
- It is possible use Geant4 classes that create categories of particles
 - G4BosonConstructor()
 - G4LeptonConstructor()

SetCuts()

- Define all production cuts for gamma, electrons and positrons
 - Recently also for protons
- Notice: this is a production cut, not a tracking cut
 - All particles, once created, are tracked down to zero kinetic energy
 - The cut is used to limit the generation of secondaries (e.g. δ-rays from ionization, or gammas from bremsstrahlung)
 - The cut is expressed in equivalent range
 This is converted in energy for each material

The definition of physics - 1

- At the beginning of Geant4 the philosophy was: "the user is in charge for deciding and implemented the most suitable models for his/her own application"
 - Completely transparent physics (no black box!)
 - Complicated to known and assess the validity of many models
- Long "flat" physics lists:
 - Explicitly associating a given model to a given particle for a given energy range
 - Done at <u>code level</u> (requires C++ coding)
- Still a possibility
 - Provided you know what you are doing

The definition of physics - 2

- Modular physics lists: the list is built from basic "blocks" (constructors)
 - The constructors are process-related (standard, lowenergy, Bertini, etc.)
 - Allows mix-and-match done by the user
 - Some constructors provided by Geant4, but users can create and register their own customized
 - Class derives from G4VModularPhysicsList which inherits from G4VUserPhysicsList
 - SetCuts() is the only mandatory virtual method
 - ConstructParticle() and
 ConstructProcess() are optional

Builder with the G4VModularPhysicsList

- AddTransportation() automatically called
- Allows the definition of "physics modules" for a given process
 - Electromagnetic
 - Hadronic
 - Decay, Optical physics, Ion physics
- User customized constructors can be created, derived class from G4VPhysicsConstructor
- Modules can be registered using the method RegisterPhysics()
 - Can be done at *run-time* (i.e. select physics via macro)

How to build a modular physics list - 1

Create a class derived by G4VModularPhysicsList
 class myList : public G4VModularPhysicsList
 Implement the mandatory method SetCuts ()
 Register the appropriate constructors (or create your own) in the constructor or in ConstructProcess()

In the first case, you cannot change at run-time

```
void myList::myList ()
{
   // Hadronic physics
   RegisterPhysics(new G4HadronElasticPhysics ());
   RegisterPhysics(new G4HadronPhysicsFTFP_BERT_TRV());
   // EM physics
   RegisterPhysics(new G4EmStandardPhysics());
```

}

How to build a modular physics list - 2

- Other option: instantiate the constructors in ConstructProcess() and invoke their own ConstructProcess()
- Constructors made out from "elementary" builders

```
void myList::ConstructProcess()
{
    //Em physics
    G4VPhysicsConstructor* emList = new G4EmStandardPhysics();
    emList->ConstructProcess();
    //Inelastic physics for protons
    G4VPhysicsConstructor* pList = new G4HadronPhysicsQGS_BIC();
    pList->ConstructProcess();
```

\$G4INSTALL/source/physics_lists/constructors

The definition of physics - 3

- Geant4 provides a few ready-for-the-use physics lists
 - Complete physics lists
 - Can be instantiated by UI (macro files)
- Provide a complete and realistic physics with ALL models of interest
- Provided according to some use-cases
 - Many options available for EM and hadronic physics
- They are intended as starting point and their builders can be reused
 - They are made up of constuctors, so easy to change/replace each given block

Reference physics lists

- These families share components to attach certain types of processes to groups of particles. These components are:
 - Electromagnetic interactions for all particles
 - Inelastic interactions
 - Elastic scattering
 - Capture
 - Decay of unstable particles
 - Specialised treatment of low energy neutrons (< 20 MeV)</p>
- They are modular physics lists by themselves, so you can register additional constructors (e.g. optical physics)

How to use a Geant4 physics list

In your main(), just register an instance of the physics list to the G4 (MT) RunManager

```
#include "QGSP_BERT.hh"
int main()
{
    // Run manager
    G4RunManager * runManager = new G4RunManager();
    ...
    G4VUserPhysicsList* physics = new QGSP_BERT();
    runManager-> SetUserInitialization(physics);
}
```

The complete lists of **Reference Physics List**

Reference Physics Lists	
A web page <u>recommending physics lists</u> according to the use case is under construction. The previo <u>still available</u> .	ous version of physics list web pages referring to 'are
String model based physics lists	
These Physics lists apply a string model for the modeling of interactions of high energy hadrons, i. ~(5-25) GeV depending on the exact physics list. Interactions at lower energies are handled by one precompound model. Nuclear capture of negative particles and neutrons at rest is handled using eit or the Bertini intranuclear cascade. Hadronic inelastic interactions use:	e. for protons, neutrons, pions and kaons above of the intranuclear cascade models or the ther the Chiral Invariant Phase Space (CHIPS) model
 a tabulation of the Barashenkov pion cross sections the Axen-Wellisch parameterization of the proton and neutron cross sections 	
The physics lists are:

Electromagnetic physics

EM concept - 1

- The same physics processes (e.g. Compton scattering) can be described by different models, that can be alternative or complementary in a given energy range
- For instance: Compton scattering can be described by
 - G4KleinNishinaCompton
 - G4LivermoreComptonModel (specialized low-energy, based on the Livermore database)
 - G4PenelopeComptonModel (specialized low-energy, based on the Penelope analytical model)
 - G4LivermorePolarizedComptonModel (specialized low-energy, Livermore database with polarization)
 - G4PolarizedComptonModel (Klein-Nishina with polarization)
 - G4LowEPComptonModel (full relativistic 3D simulation)
- Different models can be combined, so that the appropriate one is used in each given energy range (→ performance optimization)

EM concept - 2

- A physical interaction or process is described by a process class
 - Naming scheme : « G4ProcessName »
 - Eg. : « G4Compton » for photon Compton scattering
- A physical process can be simulated according to several models, each model being described by a <u>model class</u>
 - The usual naming scheme is: « G4ModelNameProcessNameModel »
 - Eg. : « G4LivermoreComptonModel » for the Livermore Compton model
 - Models can be alternative and/or complementary on certain energy ranges
 - Refer to the Geant4 manual for the full list of available models

Packages overview

 Models and processes for the description of the EM interactions in Geant4 have been grouped in several packages

Package	Description
Standard	γ -rays, e [±] up to 100 TeV, Hadrons, ions up to 100 TeV
Muons	Muons up to 1 PeV
X-rays	X-rays and optical photon production
Optical	Optical photons interactions
High-Energy	Processes at high energy (> 10 GeV). Physics for exotic particles
Low-Energy	Specialized processes for low-energy (down to 250 eV), including atomic effects
Polarization	Simulation of polarized beams

EM processes for γ -rays, e[±]

Particle	Process	G4Process	
Photons	Gamma Conversion in e [±]	G4GammaConversion	
	Compton scattering	G4ComptonScattering	
	Photoelectric effect	G4PhotoElectricEffect	
	Rayleigh scattering	G4RayleighScattering	
e⁺	Ionisation	G4eIonisation	
	Bremsstrahlung	G4eBremsstrahlung	
	Multiple scattering	G4eMultipleScattering	
e+	Annihilation	G4eplusAnnihilation	

EM processes muons

Particle	Process	G4Process
μ^{\pm}	Ionisation	G4MuIonisation
	Bremsstrahlung	G4MuBremsstrahlung
	Multiple scattering	G4MuMultipleScattering
	e [±] pair production	G4MuPairProduction

Only one model available for these processes (but in principle users may write *their own* models, if needed)

Inventory (and specs) of the models for γ-rays

 Many models available for each process

- Plus one full set of polarized models
- Differ for energy range, precision and CPU speed
 - Final state generators
- Different mixtures available the Geant4 EM constructors

Model	E _{min}	E _{max}	CPU
G4LivermoreRayleighModel	100 eV	10 PeV	1.2
G4PenelopeRayleighModel	100 eV	10 GeV	0.9
G4KleinNishinaCompton	100 eV	10 TeV	1.4
G4KleinNishinaModel	100 eV	10 TeV	1.9
G4LivermoreComptonModel	100 eV	10 TeV	2.8
G4PenelopeComptonModel	10 keV	10 GeV	3.6
G4LowEPComptonModel	100 eV	20 MeV	3.9
G4BetheHeitlerModel	1.02 MeV	100 GeV	2.0
G4PairProductionRelModel	10 MeV	10 PeV	1.9
G4LivermoreGammaConversionModel	1.02 MeV	100 GeV	2.1
G4PenelopeGammaConversionModel	1.02 MeV	10 GeV	2.2
G4PEEFluoModel	1 keV	10 PeV	1
G4LivermorePhotoElectricModel	10 eV	10 PeV	1.1
G4PenelopePhotoElectricModel	10 eV	10 GeV	2.9

Similar situation for e[±]

For example: Compton scattering

CPU time is the **price to pay** for better precision

New model: G4LowEPComptonModel (Monash U.)

- Two-body relativistic 3-dim framework
- Relativistic impulse approximation
- Bound atomic electrons
- Electron distribution not uniform in φ wrt photon scattering plane

Standard models

- Complete set of models for e^{\pm} , γ , ions, hadrons, μ^{\pm}
- Tailored to requirements from HEP applications
 - "Cheaper" in terms of CPU
 - Include high-energy corrections (e.g. LPM), assumptions made in the low-energy regime
- Theoretical or phenomenological models
 - Bethe-Bloch, corrected Klein-Nishina, ...
 - Photoabsorption Ionization (PAI)
 - ionization energy loss of a relativistic charged particle in matter
- Specific high-energy extensions available
 - Extra processes, as $\gamma \rightarrow \mu + \mu$ -, e⁺e⁻ $\rightarrow \mu + \mu$ -
- Dedicated sub-library for optical photons
 - Produced by scintillation or Cherenkov effect

Livermore (& polarized) models

- Based on publicly available evaluated data tables from the Livermore data library: e⁻, γ
 - EADL : Evaluated Atomic Data Library, EEDL : Evaluated Electrons Data Library, EPDL97 : Evaluated Photons Data Library, Binding energies: Scofield
 - Mixture of experiments and theories
 - In principle, tables go down to ~10 eV
- <u>Applications</u>: medical, underground and rare events, space
- Polarized models
 - Same calculation of the cross section, different way to produce the final state
 - Describe in detail the kinematics of polarized photon interactions
 - Application: space missions for the detection of polarized photons

Penelope models

- Geant4 includes the low-energy models for electrons, positrons and photons from the Monte Carlo code PENELOPE (PENetration and Energy LOss of Positrons and Electrons)
 - Nucl. Instr. Meth. B 207 (2003) 107
 - Geant4 implements v2008 of Penelope
- Physics models specifically developed by the group of F. Salvat et al.
 - Great care dedicated to the low-energy description
 - Atomic effects, fluorescence, Doppler broadening...
- Mixed approach: analytical, parameterized and databasedriven
 - Applicability energy range: 100 eV 1 GeV
- Include positrons
 - Not described by Livermore models

When/why to use Low Energy Models

- Use Low-Energy models (Livermore or Penelope), as an *alternative* to Standard models, when you:
 - need precise treatment of EM showers and interactions at low-energy (keV scale)
 - are interested in atomic effects, as fluorescence x-rays, Doppler broadening, etc.
 - can afford a more CPU-intensive simulation
 - want to cross-check an other simulation (e.g. with a different model)
- Do not use when you are interested in EM physics > MeV
 - same results as Standard EM models, performance penalty

Example: PhysicsList, γ-rays

G4ProcessManager* pmanager = G4Gamma::GetProcessManager(); pmanager->AddDiscreteProcess(new G4PhotoElectricEffect); pmanager->AddDiscreteProcess(new G4ComptonScattering); pmanager->AddDiscreteProcess(new G4GammaConversion); pmanager->AddDiscreteProcess(new G4GammaConversion);

• Use **AddDiscreteProcess** because γ-rays processes have only PostStep actions

• For each process, the default model is used among all the available ones (e.g. G4KleinNishinaCompton for G4ComptonScattering)

EM Physics Constructors for Geant4 10.1 - ready-for-the-use

G4EmStandardPhysics G4EmStandardPhysics_option1 – HEP fast but not precise G4EmStandardPhysics_option2 – Experimental G4EmStandardPhysics_option3 – medical, space G4EmStandardPhysics_option4 – optimal mixture for precision G4EmLivermorePhysics G4EmLivermorePolarizedPhysics G4EmPenelopePhysics G4EmLowEPPhysics **G4EmDNAPhysics**

- default

Combined Physics Standard > 1 GeV LowEnergy < 1 GeV

- \$G4INSTALL/source/physics_list/constuctors
- Advantage of using of these classes they are tested on regular basis and are used for regular validation

How to extract Physics ?

- Possible to retrieve physics quantities via G4EmCalculator or directly from the physics models
 - Physics List should be initialized
- Example for retrieving the total cross section (cm⁻¹) of a process with name *procName*: for particle *partName* and material *matName*

G4EmCalculator **emCalculator**;

G4Material* material =

G4NistManager::Instance()->FindOrBuildMaterial("matName);

G4double massSigma = **emCalculator.ComputeCrossSectionPerVolume** (energy,particle,procName,material);

G4cout << G4BestUnit(massSigma, "Surface/Volume") << G4endl;

A good example: \$G4INSTALL/examples/extended/electromagnetic/ TestEm14

Hadronic physics

-

Hadronic Physics

- Data-driven models
- Parametrised models
- Theory-driven models

Hadronic physics challenge

- Three energy regimes
 - < 100 MeV</pre>
 - resonance and cascade region (100 MeV 10 GeV)
 - > 20 GeV (QCD strings)
- Within each regime there are several models
- Many of these are phenomenological

Reference physics lists for Hadronic interactions

Three families of builders

- OGS, or list based on a model that use the Quark Gluon String model for high energy hadronic interactions of protons, neutrons, pions and kaons
- FTF, based on the FTF (FRITIOF like string model) for protons, neutrons, pions and kaons
- Other specialized physics lists
- Up to Geant4 9.6: LEP and HEP
 - parameterised modelling of hadronic interactions
 - Based on the old GEISHA package of Geant3
 - Deprecated as obsolete, dismissed from version 10.0

Hadronic processes

- At rest
 - Stopped muon, pion, kaon, anti-proton
 - Radioactive decay
 - Particle decay (decay-in-flight is PostStep)
- Elastic
 - Same process to handle all long-lived hadrons (multiple models available)
- Inelastic
 - Different processes for each hadron (possibly with multiple models vs. energy)
 - Photo-nuclear, electro-nuclear, mu-nuclear
- Capture
 - Pion- and kaon- in flight, neutron
- Fission

Cross sections

- Default cross section sets are provided for each type of hadronic process:
 - Fission, capture, elastic, inelastic
- Can be overridden or completely replaced
- Different types of cross section sets:
 - Some contain only a few numbers to parameterize cross section
 - Some represent large databases (data driven models)
- Cross section management
 - GetCrossSection() → sees last set loaded for energy range

Alternative cross sections

- To be used for specific applications, or for a given particle in a given energy range, for instance:
- Low energy neutrons
 - elastic, inelastic, fission and capture (< 20 MeV)
- Neutron and proton inelastic cross sections
 - 20 MeV < E < 20 GeV</p>
- Ion-nucleus reaction cross sections (several models)
 - Good for E/A < 1 GeV
- Isotope production data
 - E < 100 MeV
- Photo-nuclear cross sections

Information on the available cross sections at

http://geant4.cern.ch/support/proc_mod_catalog/cross_sections/

Neutron HP Models

- Transport of **low-energy neutrons** in matter:
 - The energy coverage of these models is from thermal energies to 20 MeV
 - The modeling is based on the data formats of ENDF/B-VI, and all distributions of this standard data format are implemented
 - Includes cross sections and final state information for *elastic* and inelastic scattering, capture, fission and isotope production
 - The file system is used in order to allow granular access to, and flexibility in, the use of the cross-sections for different isotopes, and channels
 - Code in sub-directory: /source/processes/hadronic/models/neutron_hp

Hadronic model inventory

http://geant4.cern.ch/support/proc_mod_catalog/models

<u>Old picture</u>: LEP models dismissed meanwhile: BERT interfaced directly to QGS/Preco at 9.9 GeV

Code example (2/2)

Quick overview of validation

EM validation - 1

- Tens of papers and studies available
 - Geant4 Collaboration + User Community
- Results can depend on the specific observable/reference
 - Data selection and assessment critical

EM validation – 2

- In general satisfactory agreement
- Validation/verification repository available on web

http://cern.ch/vnivanch/verification/verification/electromagnetic/

Hadronic validation

- A website is available to collect relevant information for validation of Geant4 hadronic models (plots, tables, references to data and to models, etc.) http://geant4.cern.ch/results/validation_plots.htm http://g4validation.fnal.gov:8080/G4ValidationWebApp/
- Several physics lists and several use-cases have been considered (e.g. thick target, stopped particles, lowenergy)
- Includes final states and cross sections

Some verification: channel cross section

Some verification: secondary energy spectrum

Nuclear fragmentation

Bertini and Binary cascade models: neutron production vs. angle from 1.5 GeV protons on Lead

Neutron production by protons

Binary cascade model: double differential cross-section for neutrons produced by 256 MeV protons impinging on different targets
