## **Beam Dynamics studies for the X-band Linac**

Cristina Vaccarezza

---

On behalf of SPARC\_LAB collaboration

- Introduction
- The Linac layout & parameter list
- WP's details
- BD studies for the nominal cases
- FEL simulation results from V. Petrillo
- Static and dynamic error studies: first results
- Conclusions

In the framework of the Eupraxia Design Study an advanced accelerator facility EUPRAXIA at SPARC\_LAB has been proposed to be realized at Frascati (Italy) Laboratories of INFN.

Two advanced acceleration schemes will be applied:

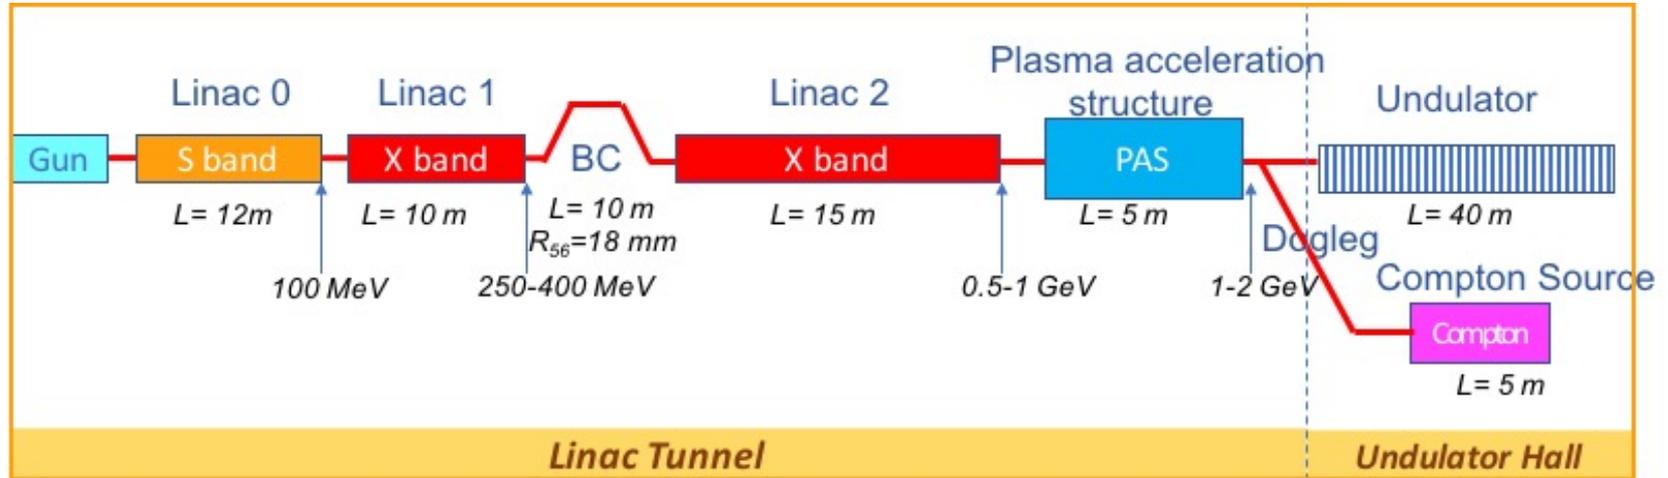

- an ultimate high gradient 1 GeV X-band linac and
- a plasma acceleration stage to provide accelerating gradients of the GeV/m order.

A FEL scheme is foreseen to produce X-ray beams within 3-10 nm range.

A 500-TW Laser system is also foreseen for electron and ion production/acceleration experiments and a Compton backscattering Interaction is planned together with extraction beamlines at intermediate electron beam energy for neutron beams and THz radiation production.

**See M. ferrario talk today WP1-8 session at 18:00**

# The Linac Layout

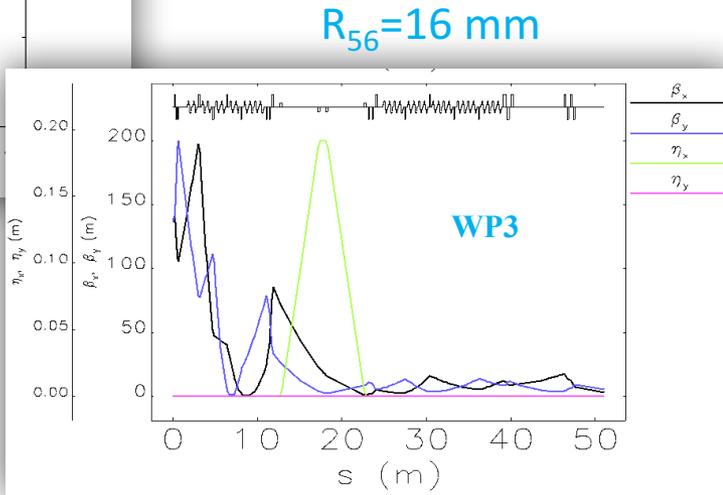

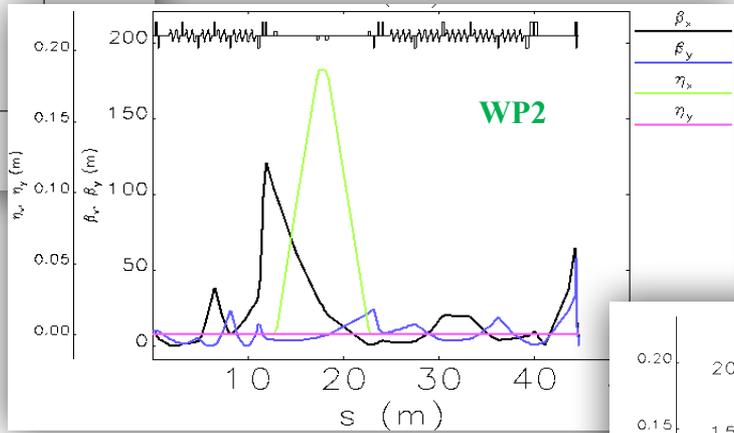

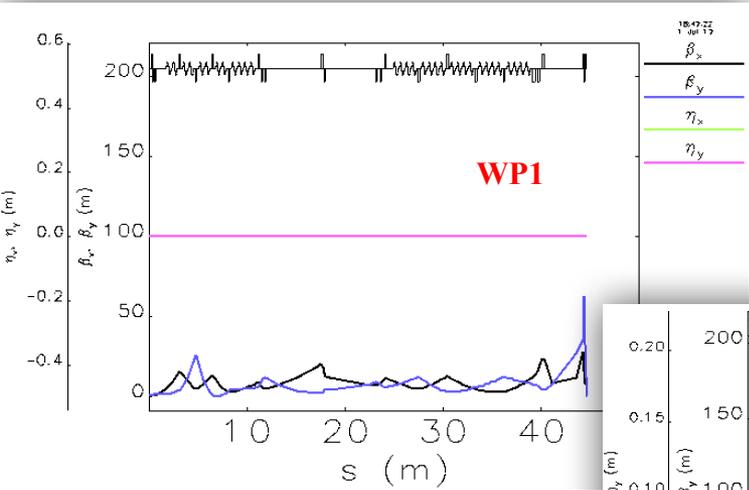

- S-band photoinjector: Gun+2÷3 acc. structures
- X-band Linac: 32 structures (50 cm)
- Plasma Acceleration Stage
- Magnetic chicane & Transfer Lines

# Linac 1 & 2 parameter list for 3 WP's

- **WP1:** Low Charge-High Current from the Photoinjector: 30 pC-3kA (FWHM) per bunch with only velocity bunching, suitable both for Beam Driven and Laser driven acceleration in Plasma
- **WP2:** Low Charge-Low Current from Photoinjector: 30 pC-100A per bunch, velocity bunching coupled with a magnetic longitudinal compression stage in the chicane to reach the desired current  $I = 3\text{kA}$  (Hybrid scheme), suitable both for Beam Driven and Laser driven acceleration in Plasma
- **WP3:** High charge-Low Current from Photoinjector: 200 pC-70 A, with and without the longitudinal bunch compression in the magnetic chicane to serve both the SASE-FEL, with peak current  $I_{pk}=2\text{kA}$ , and the Compton Source in the high flux operation scheme.

Beam Parameter	Unit	L1			L2		
		WP1	WP2	WP3	WP1	WP2	WP3
Initial energy	GeV	0.01	0.17	0.17	.21	.28	.51
Final energy	GeV	0.21	0.28	.55	.55	0.55	1.06
Active Linac length	m	6.0			10.0		
Accelerating Gradient	MV/m	20.0	20.0	57.0	36.0	26.8	57.0
RF phase (crest at 0)	deg	-20.0	-20.0	-12.0	-19.5	0	+15.0
Initial rms energy spread	%	0.30	0.22	0.67	0.15	0.22	0.47
Final rms energy spread	%	0.15	0.22	0.47	0.07	0.06	0.09
rms bunch length	$\mu\text{m}$	3	20	112	3	4	20

# Long & Transv Wake field

See M.Diomede "Preliminary RF design of an X-Band LINAC for the EuSPARC/EuPRAXIA@SPARC\_LAB proposals", this conference

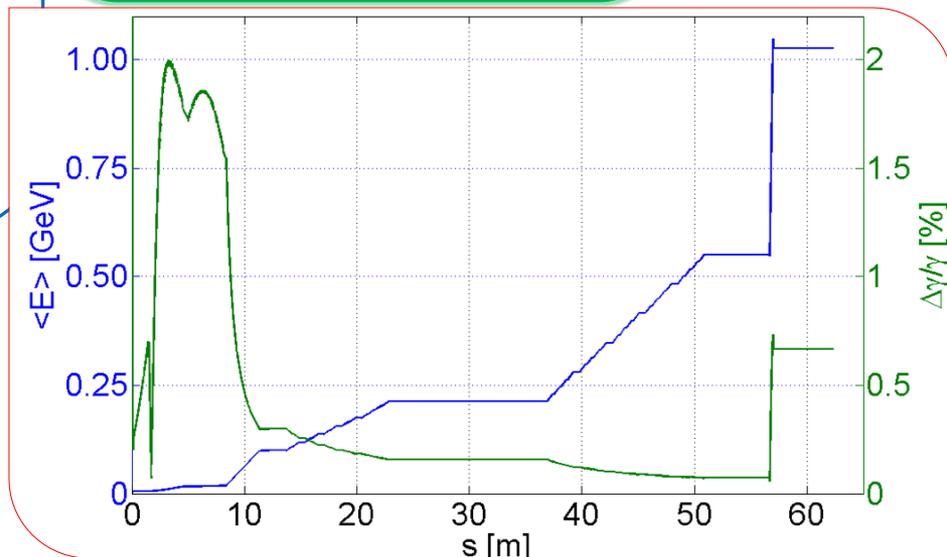

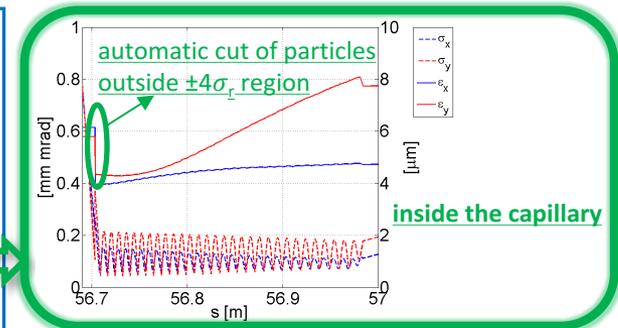

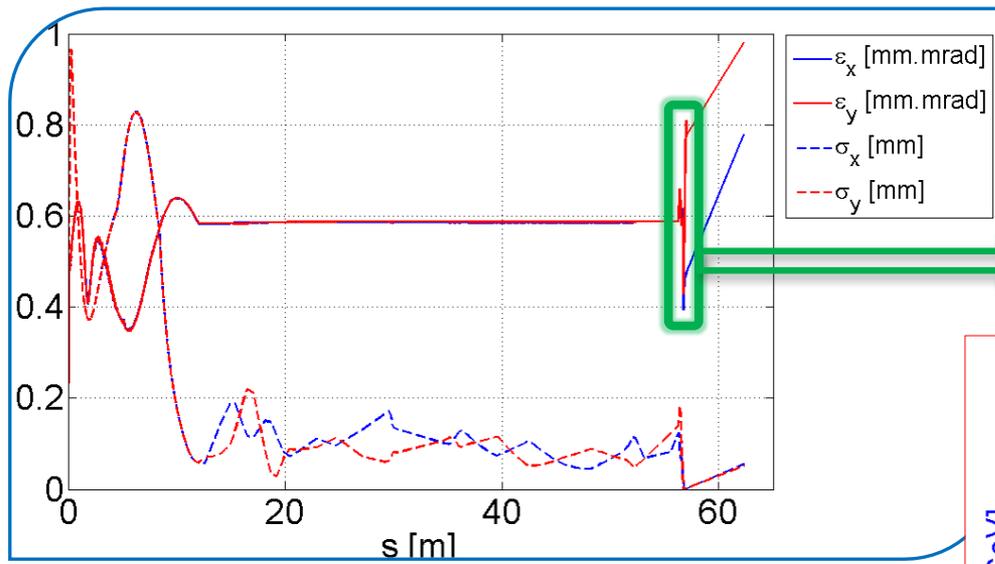

Pill box cavity model considered for the wake field calculations:  $a$  is the iris radius,  $L$  is the cell length. The asymptotic values of the longitudinal and transverse wake functions have been calculated according to K. Bane SLAC{PUB{7862 (Revised) November 1998 with  $a=3.2$  mm)

Geometrical parameters	
$a$ [mm]	$2 \div 5$
$b$ [mm]	$9.828 \div 10.917$
$d$ [mm]	$8,332 (2\pi/3 \text{ mode})$
$r$ [mm]	1
$t$ [mm]	2.5

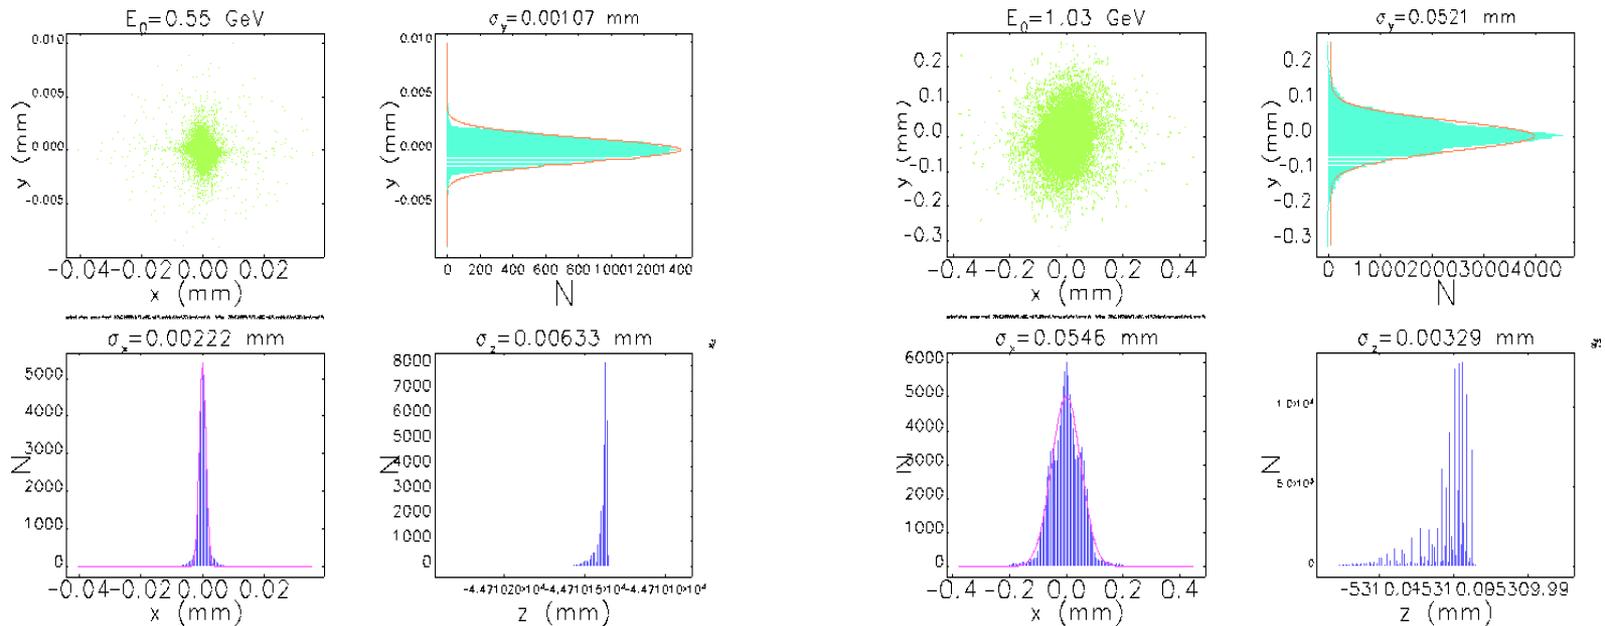

Longitudinal and transverse wakefield calculated for an iris radius of 3.2 mm and a cell length of 8.332 mm.

# WP1 case: 30 pC beam evolution from Cathode to Undulator

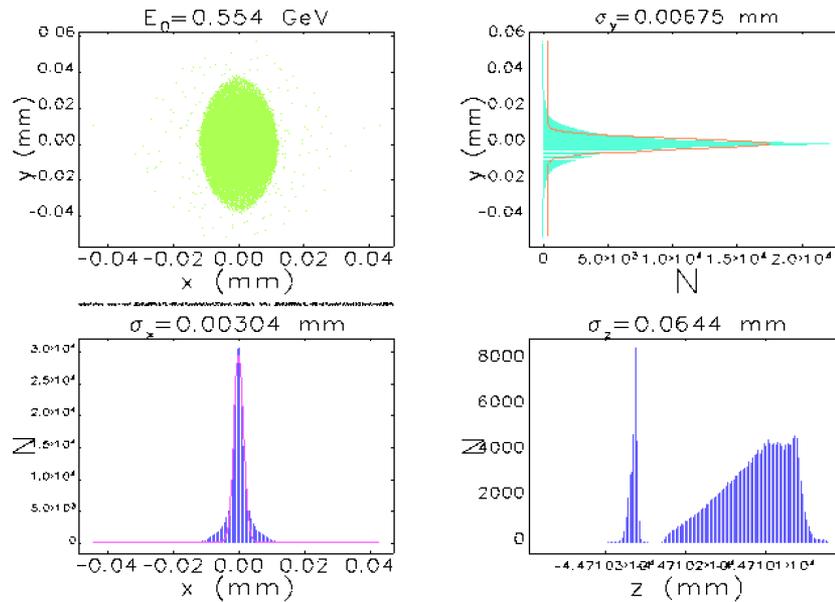

# WP1 case: Transverse electron beam distribution (witness bunch)

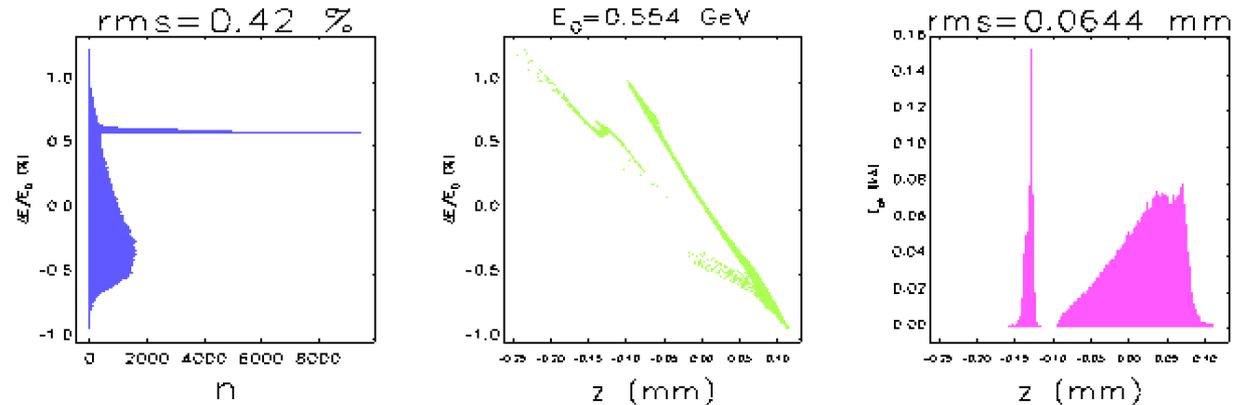

- before the plasma acceleration
- undulator entrance (capillary entrance)

Transverse distribution at the entrance of the plasma capillary.

Longitudinal phase at the entrance of the plasma capillary.

In the undulator

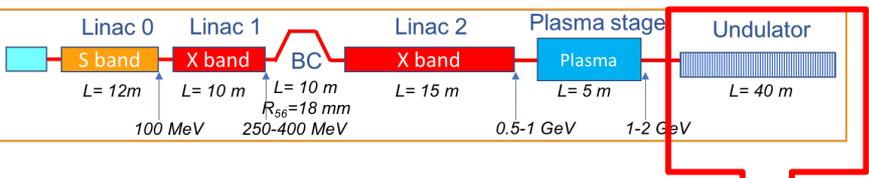

Choice of the radiation scheme and undulator parameters

The comparison between the possible radiation schemes makes clear that seeding and cascaded techniques should require a linear space larger than the allocated one and could be considered for future upgrades. The stringent condition i) induced us to consider as primary option the use of a **conventional, not segmented undulator** and the operation in the **SASE mode**, with the possibility of exploiting the **single spike regime** for increasing the radiation coherence, combined potentially with the undulator tapering.

$$\lambda = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2}\right)$$

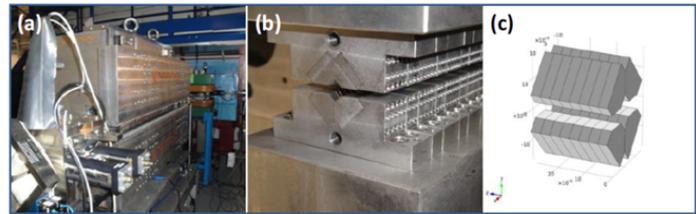

$$\gamma = 2000$$

- The X-band Linac for the EUPRAXIA@SPARC\_LAB is under design
- This stage focuses on three different WP's nominal requirements and is meant to explore the line acceptance and robustness
- BD studies and FEL simulations have been presented for the nominal cases
- As first test bench the active elements (RF & magnetic) misalignments have been considered.
- These first results give an indication on the required tolerances and machine operation scenario (ex. active element and trajectory feedback ) .
- Next steps will include RF phase and amplitude jitters, and Photocathode laser energy and pointing jitters.
- The space charge effects taken into account so far only on the nominal wps will be also considered.
