

Nuclear Astrophysics

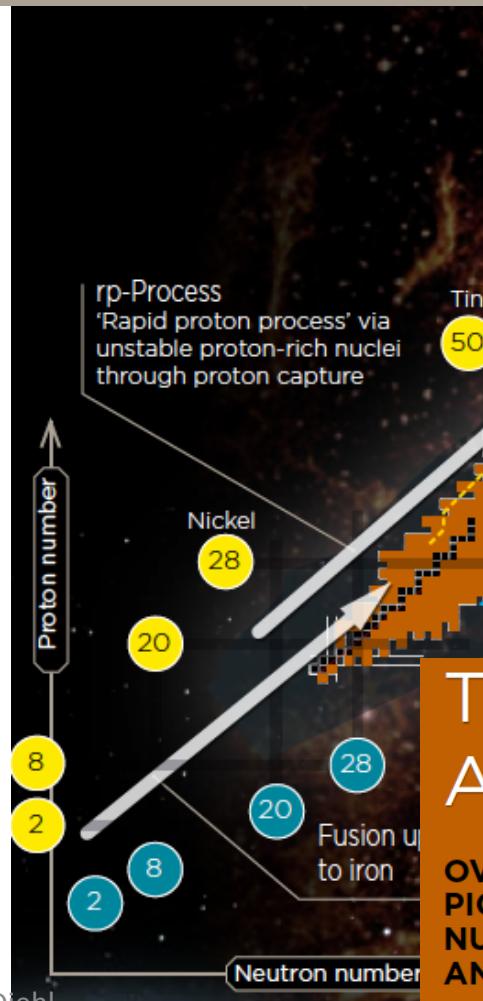

(*INTEGRAL Spectroscopy and eAstrogam*)

Roland Diehl

(MPE Garching, Germany)

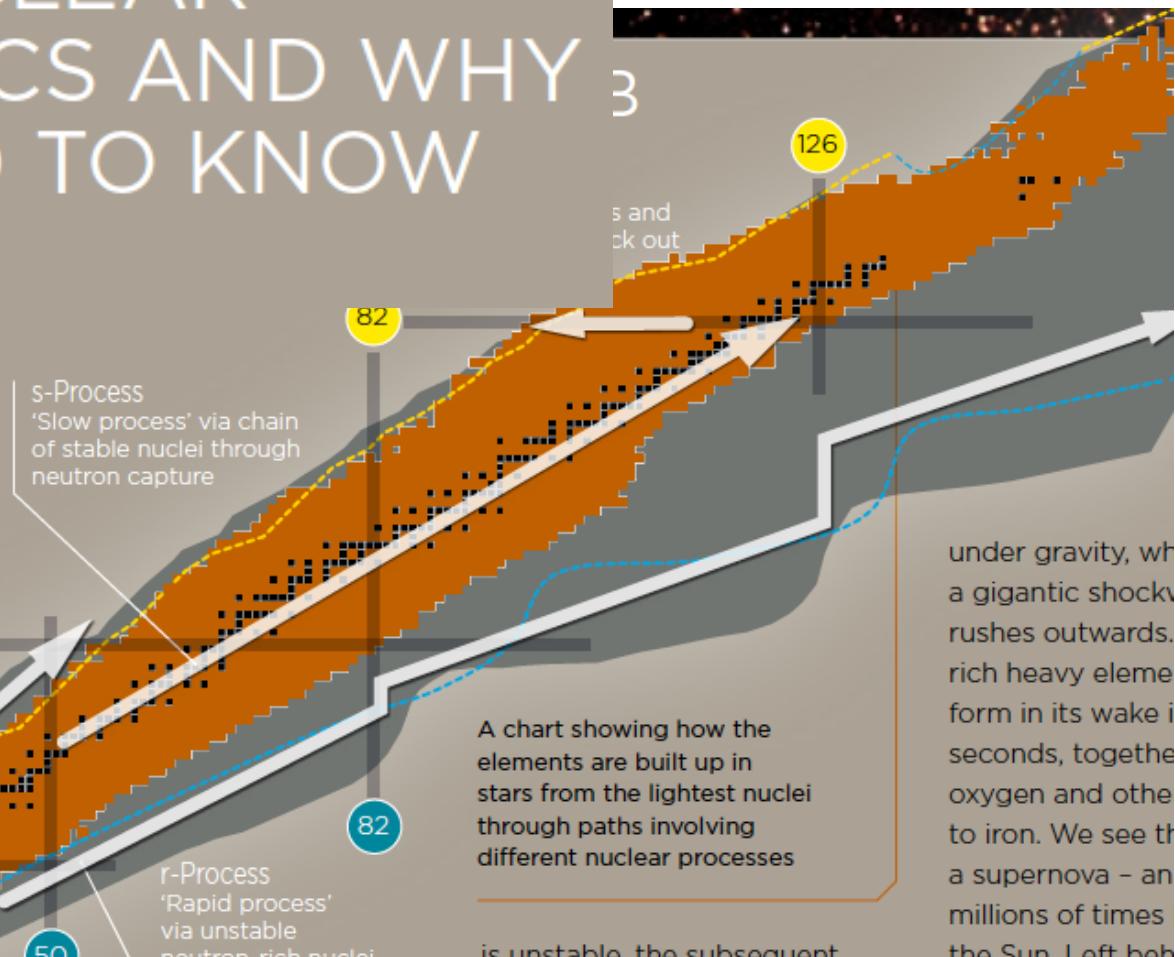

WHAT IS NUCLEAR ASTROPHYSICS AND WHY DO WE NEED TO KNOW ABOUT IT?

THE CREATION OF THE ELEMENTS AND THEIR ROLE IN THE UNIVERSE

OVER THE PAST CENTURY, WE HAVE BUILT UP A COMPREHENSIVE PICTURE OF WHAT STARS ARE, OF THEIR DIVERSE LIFE-CYCLES, AND HOW NUCLEOSYNTHESIS IN STARS HAS SHAPED THE EVOLUTION OF THE UNIVERSE AND LED TO THE FORMATION OF PLANETARY SYSTEMS LIKE OURS

Roland Diehl

eAstrogam Workshop, Padua (I), Feb 28, 2017

STARS, THE ORIGIN OF THE ELEMENTS AND US

TRACING THE PATH FROM STARDUST TO PEOPLE

WHY DOES THE SUN SHINE?

The build-up of elements in a typical star

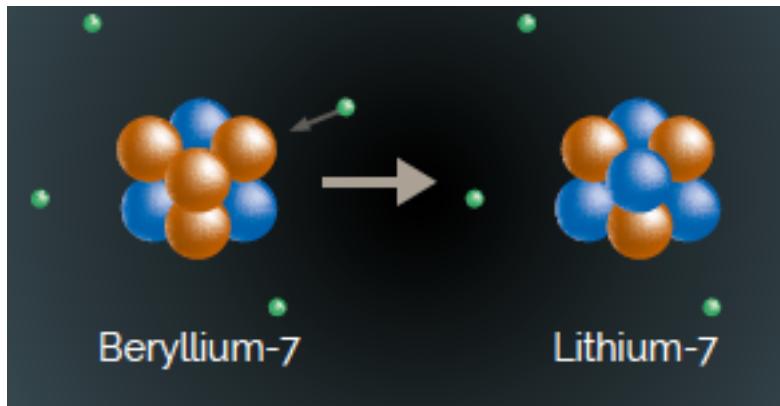

hydrogen, helium
helium, nitrogen
helium, carbon, n
oxygen, carbon
oxygen, neon, m
silicon, sulphur
nickel, iron (inert core) } only if 10+ solar mass

“WHERE DO THE ELEMENTS COME FROM, HOW WERE THEY MADE AND WHY IS THERE SO MUCH MORE OF ONE ELEMENT THAN ANOTHER? THE ANSWERS ARE BOTH EXOTIC AND MYSTERIOUS – AND LIE IN THE STARS.”

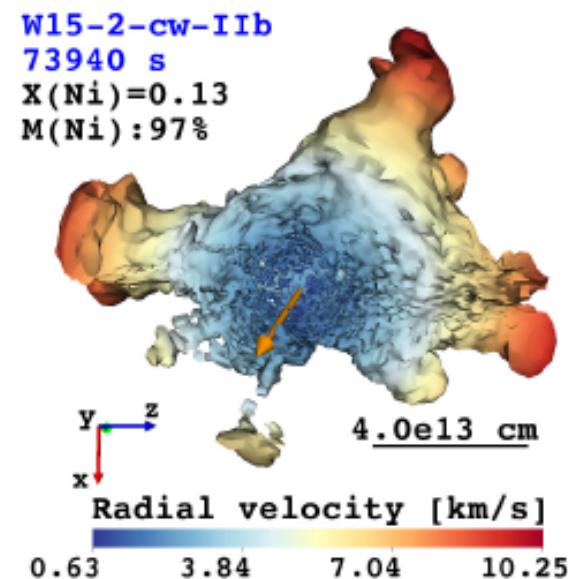

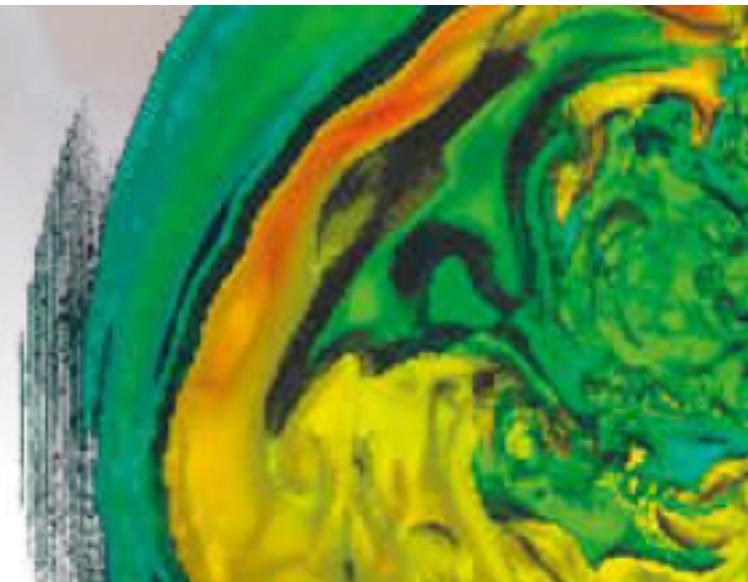

THE MYSTERIES TO UNCOVER

ADVANCED STAGES OF NUCLEAR BURNING

There is a huge dearth of information about the reaction paths leading to the heavier elements. They require much better theoretical models of nuclear structure and stability, to be supported by new experimental measurements using both stable and radioactive nuclear beams to investigate the complex variety of pertinent reactions and their outcomes.

a
wide
range...

Science Questions in Nuclear Astrophysics

- Where do isotopes originate?
- How does nuclear fusion shape stars?
- How do supernovae explode?
- How do novae and Type-I X-ray bursters work?
- Nucleosynthesis in extremes: big bang; BH vicinity;
- How are cosmic rays accelerated & propagated?
- Extremes of matter: BH vicinity; compact-star collisions; jet environments

Gamma-Ray Lines and their Messages

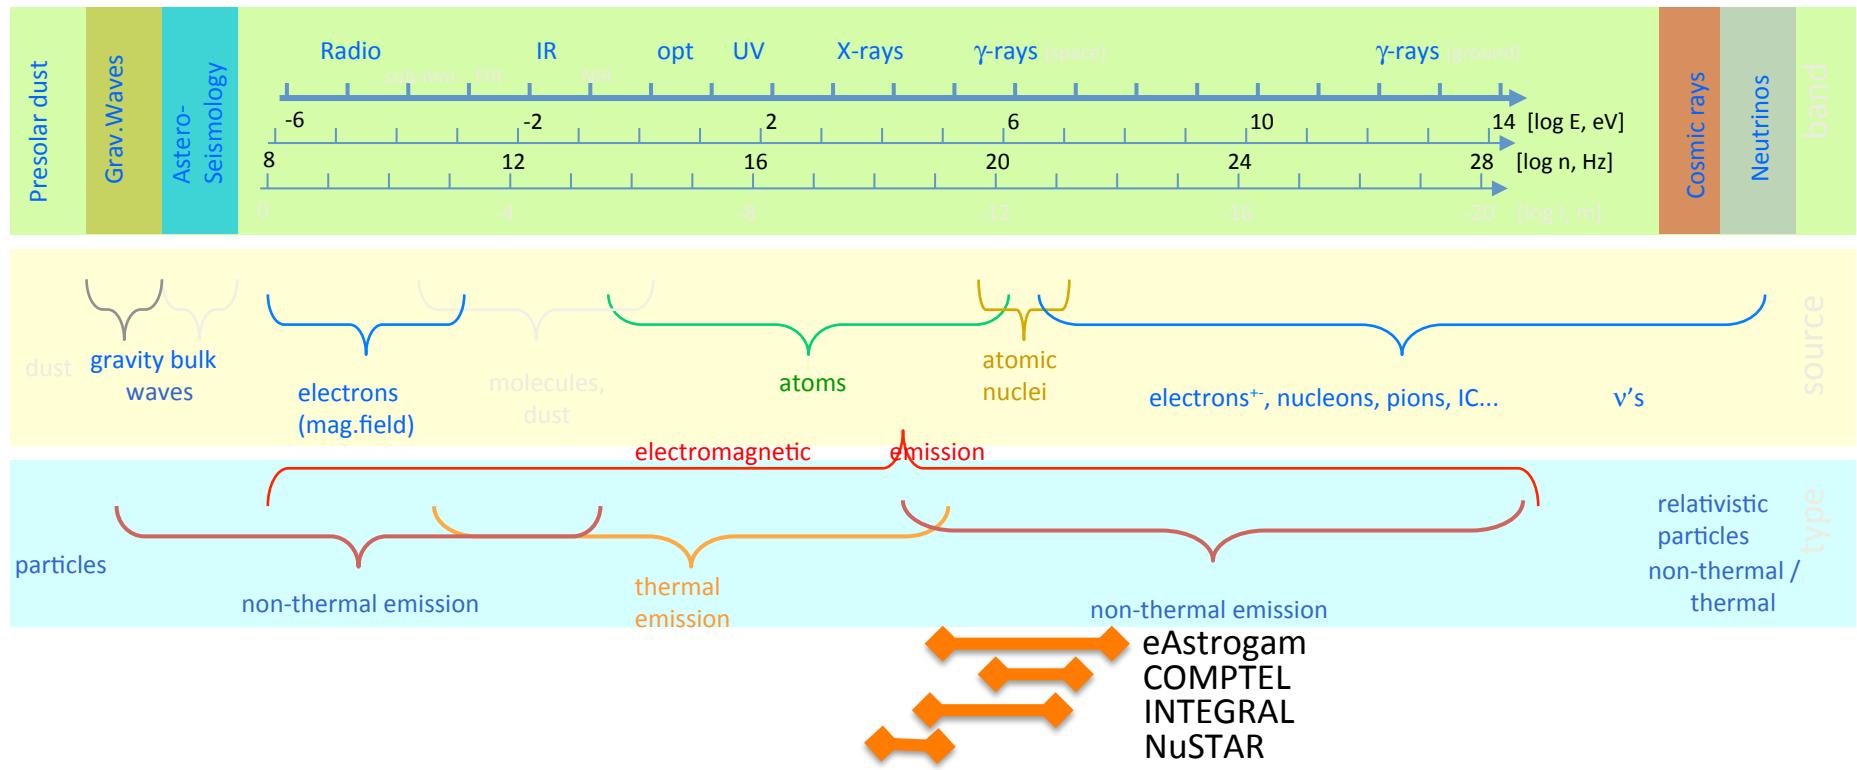

- Radioactive Trace Isotopes are Nucleosynthesis By-Products

Isotope	Mean Lifetime	Decay Chain	γ -Ray Energy (keV)	
^7Be	77 d	$^7\text{Be} \rightarrow ^7\text{Li}^*$	478	
^{56}Ni	111 d	$^{56}\text{Ni} \rightarrow ^{56}\text{Co}^* \rightarrow ^{56}\text{Fe}^* + e^+$	158, 812; 847, 1238	
^{57}Ni	390 d	$^{57}\text{Co} \rightarrow ^{57}\text{Fe}^*$	122	
^{22}Na	3.8 y	$^{22}\text{Na} \rightarrow ^{22}\text{Ne}^* + e^+$	1275	
^{44}Ti	85 y	$^{44}\text{Ti} \rightarrow ^{44}\text{Sc}^* \rightarrow ^{44}\text{Ca}^* + e^+$	78, 68; 1157	
^{26}Al	$1.04 \cdot 10^6$ y	$^{26}\text{Al} \rightarrow ^{26}\text{Mg}^* + e^+$	1809	
^{60}Fe	$3.8 \cdot 10^6$ y	$^{60}\text{Fe} \rightarrow ^{60}\text{Co}^* \rightarrow ^{60}\text{Ni}^*$	59, 1173, 1332	
e^+	$\dots \cdot 10^5$ y	$e^+ + e^- \rightarrow \text{Ps} \rightarrow \gamma\gamma\dots$	511, <511	

} individual object/event
} cumulative from many events

- For Gamma-ray Spectroscopy We Need:
 - Decay Time > Source Dilution Time (\rightarrow no < days lifetimes)
 - Yields > Instrumental Sensitivities (\rightarrow no elements > Fe)

Astronomical windows for nuclear physics

- Nuclear processes (i.e. atomic nuclei de/excitations): 0.05 – 16 MeV
- Nucleosynthesis presolar grains
- Nuclear processes (spallation) CRs (near Earth)
- Nucleosynthesis neutrinos (Sun;...)
- Chemical evolution abundances in stars, ISM, ... opt, sub-mm, X-rays
- ...

Nucleosynthesis in cc-SN : Density/Temperature Regimes

NuGrid collaboration (Magkotsios et al., ApJ 2011)

“For each region only certain reactions affect the yields of ^{44}Ti ”

SN1987A with IBIS on INTEGRAL

- INTEGRAL Line Band Imaging with IBIS *(Grebenev+2012)*
 - Detection (5σ) (6 Ms exposure)

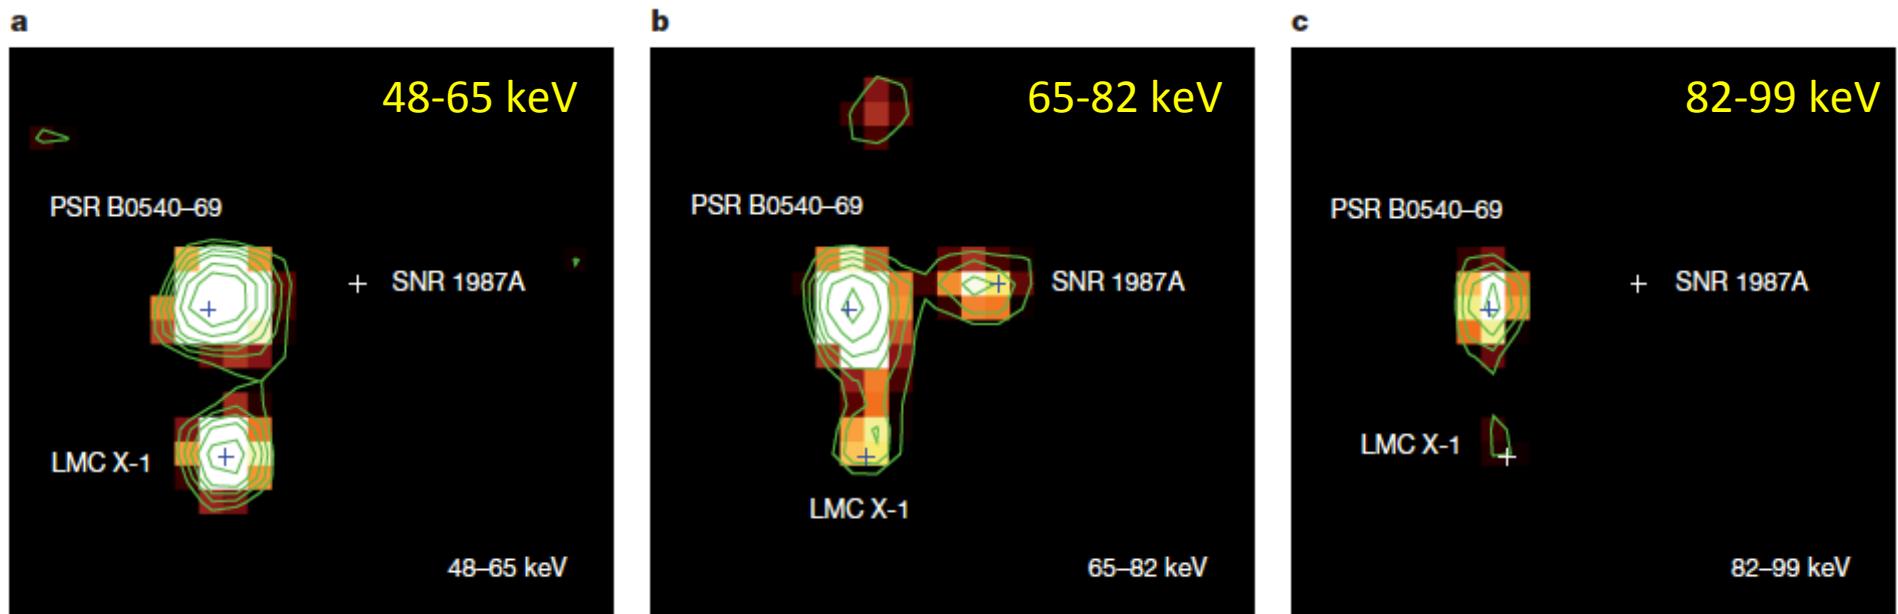

Figure 1 | Hard-X-ray images indicating the detection of ^{44}Ti emission lines from SNR 1987A. a–c, Maps of the signal-to-noise ratio (S/N) of the $1.5^\circ \times 1.5^\circ$ sky region around SNR 1987A accumulated in three energy bands with the IBIS/ISGRI telescope on board INTEGRAL during observations in 2003–2011 (~ 6.0 Ms of real exposure or ~ 4.2 Ms of dead-time-corrected exposure): 48–65 keV (a); 65–82 keV (b); 82–99 keV (c). The maps were

reconstructed using standard techniques²⁷ with contours given at S/N levels of 2.7, 3.3, 3.9, 4.5, 5.4 and 6.3. Two well-known sources, PSR B0540–69 and LMC X-1, are seen bright in all three images, but SNR 1987A is confidently detected only in b, in the band that contains the 67.9- and 78.4-keV direct-escape lines of radioactive ^{44}Ti decaying inside the ejecta.

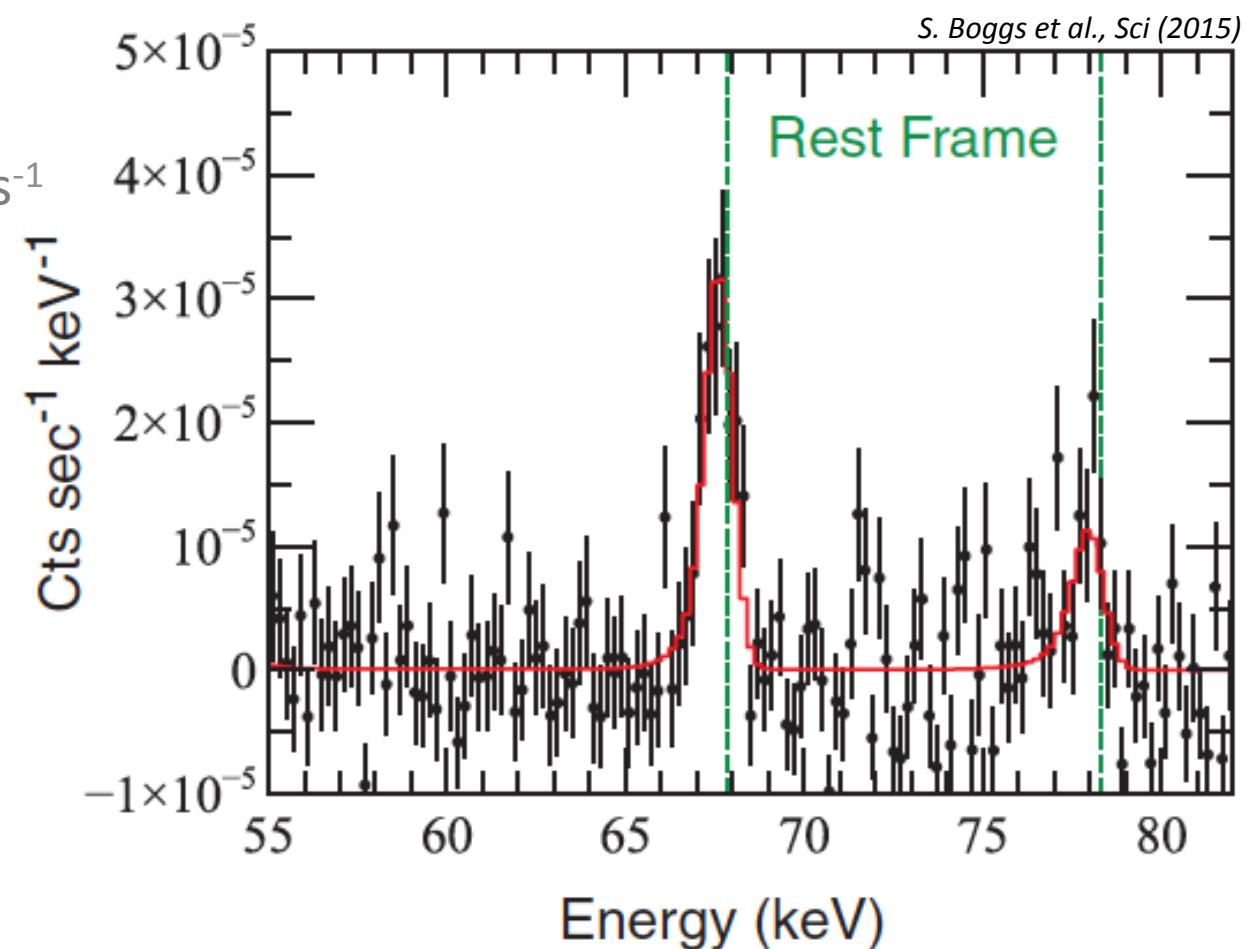

$$\text{Flux } 1.7 \cdot 10^{-5} \text{ ph cm}^{-2} \text{ s}^{-1} \rightarrow 3.5 \cdot 10^{-4} M_{\odot} \text{ of } ^{44}\text{Ti}$$

NuSTAR and ^{44}Ti : SN1987A

Measuring hard X-ray lines at 68,78 keV

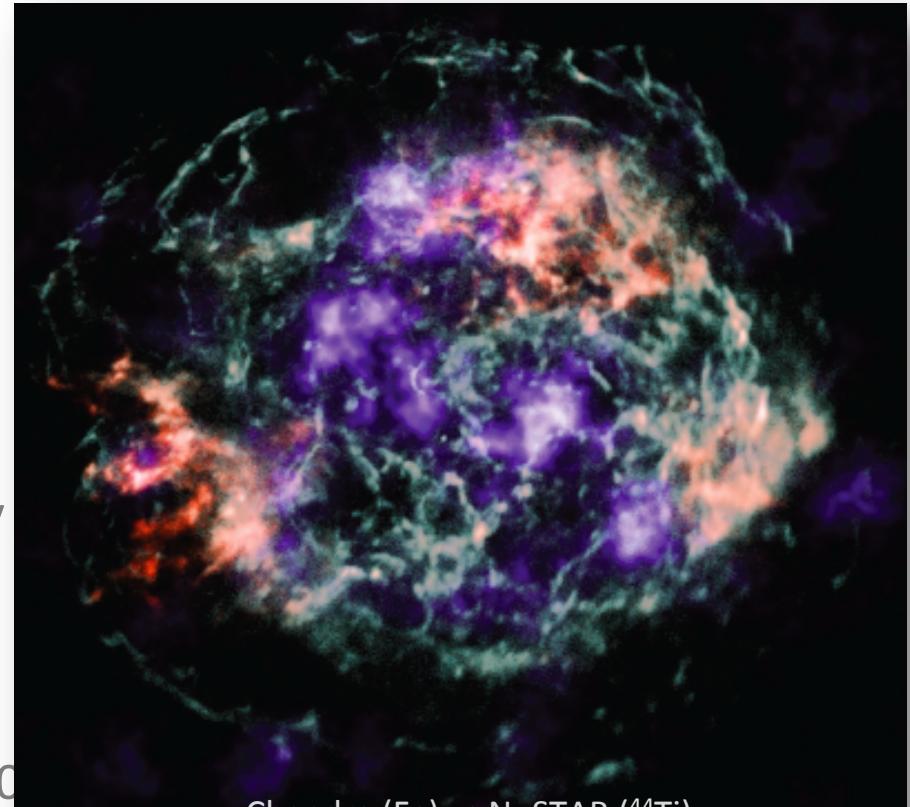

(no image: 'point src' for NuSTAR)

- Flux:
 $3.5_{(\pm 0.7)} 10^{-5} \text{ ph cm}^{-2} \text{ s}^{-1}$
 $\rightarrow 1.5 10^{-4} M_{\odot}$
- Line width
 \rightarrow ejecta velocity
 $\sim 4000 \text{ km s}^{-1}$
- Confirm earlier indications for redshift of new-nuclei ejecta ($\sim 700_{(\pm 400)} \text{ km s}^{-1}$)
 \rightarrow SN asymmetry

NuSTAR measurement of ^{44}Ti in Cas A

- Imaging in hard X-rays (3-79 keV) → ^{44}Ti lines at 68,78 keV
 - Cas A: first mapping of radioactivity in a SNR
 - Both ^{44}Ti lines detected clearly
 - line redshift 0.5 keV
→ 2000 km/s redshift asymmetry
 - Image differs from Fe!!
 - ^{44}Ti flux consistent with earlier measurements
 - Doppler broadening: (5350 ± 1610)
 - Flux in 68 keV line: $(1.53 \pm 0.31) 10^{-5} \text{ ph cm}^{-2} \text{ s}^{-1} \rightarrow (1.25 \pm 0.3) 10^{-4} M_{\odot}$
 - 2017 update: $(1.84 \pm 0.25) 10^{-5} \text{ ph cm}^{-2} \text{ s}^{-1} \rightarrow (1.54 \pm 0.2) 10^{-4} M_{\odot}$

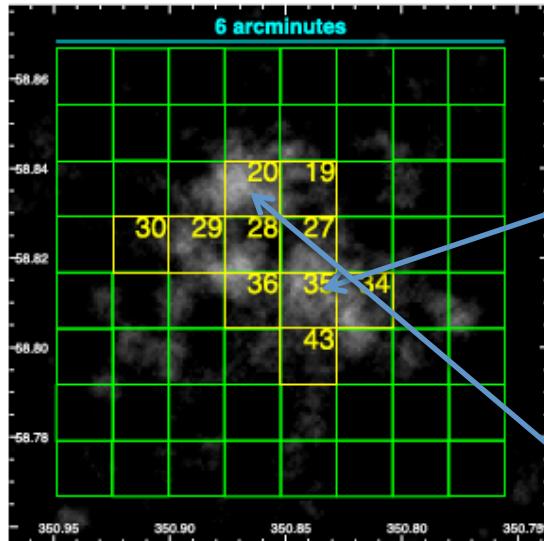

Chandra (Fe) vs NuSTAR (^{44}Ti)

Grefenstette et al. 2014

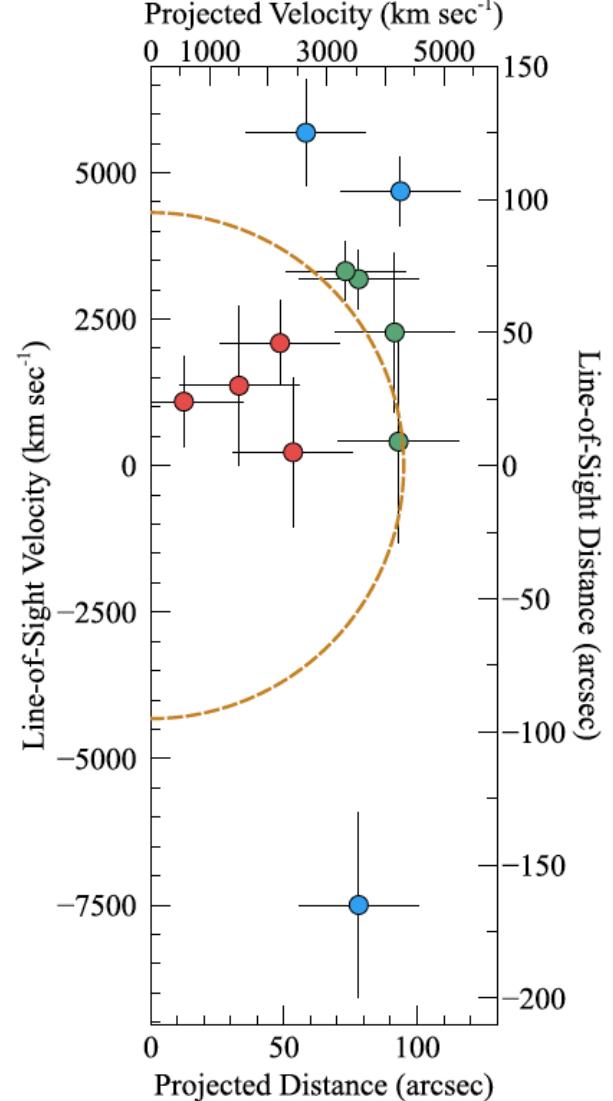

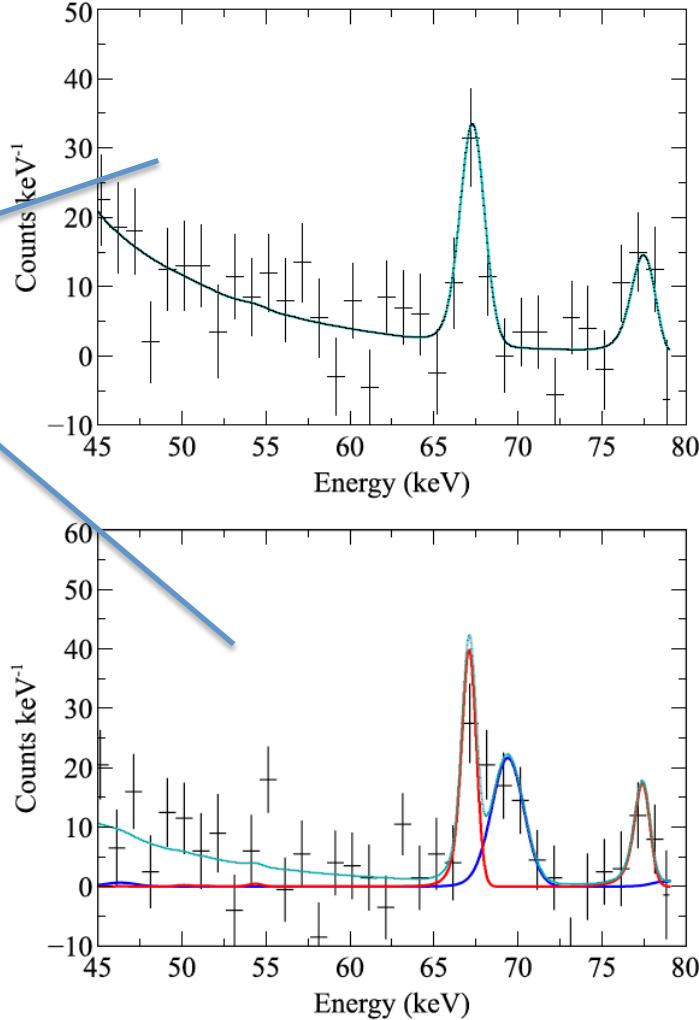

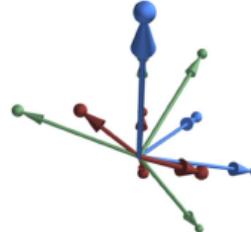

NuSTAR update: ^{44}Ti in Cas A

2.4 Msec NuSTAR campaign
Grefenstette et al. 2017

→ motion away
from us,
and in clumps

^{44}Ti γ -rays from Cas A

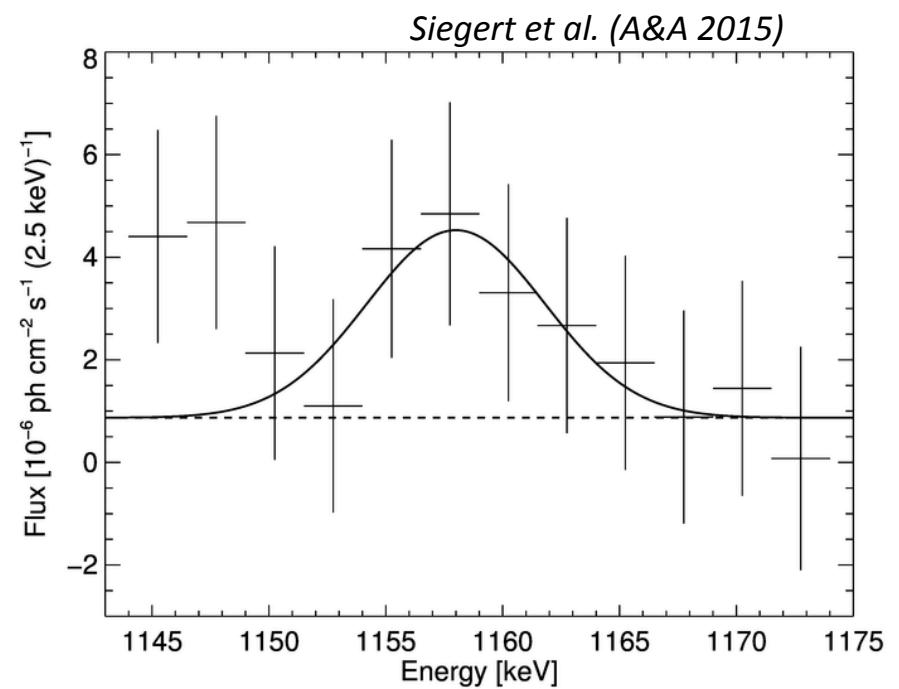

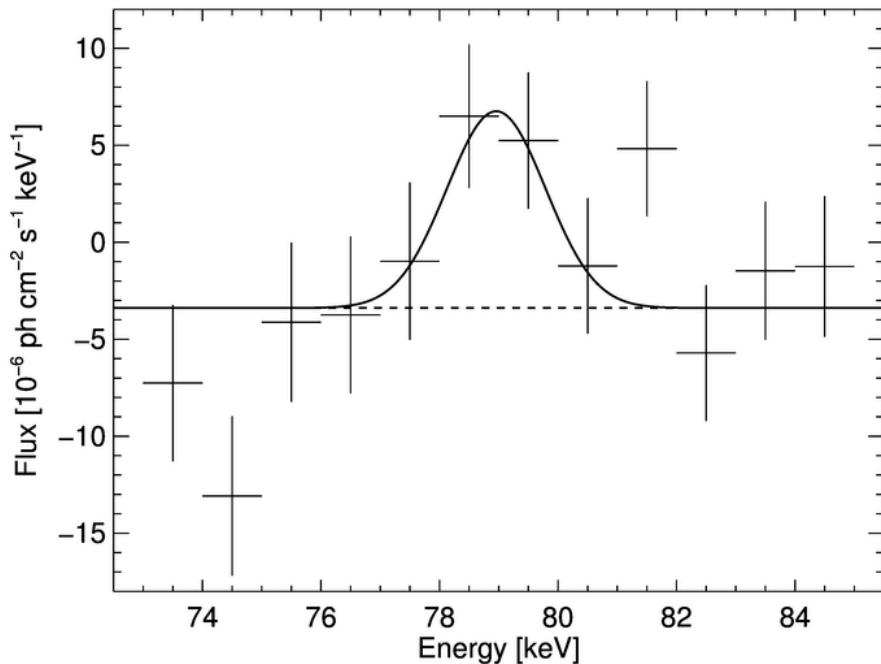

^{44}Ti Ejected Mass $\sim 1.23_{\pm 0.25} 10^{-4} M_\odot$

SPI Re-Analysis of Cas A for ^{44}Ti

Using cumulative data from >12 years,
and a new instrumental-background treatment

→ We see the 78 keV and 1157 keV line emission

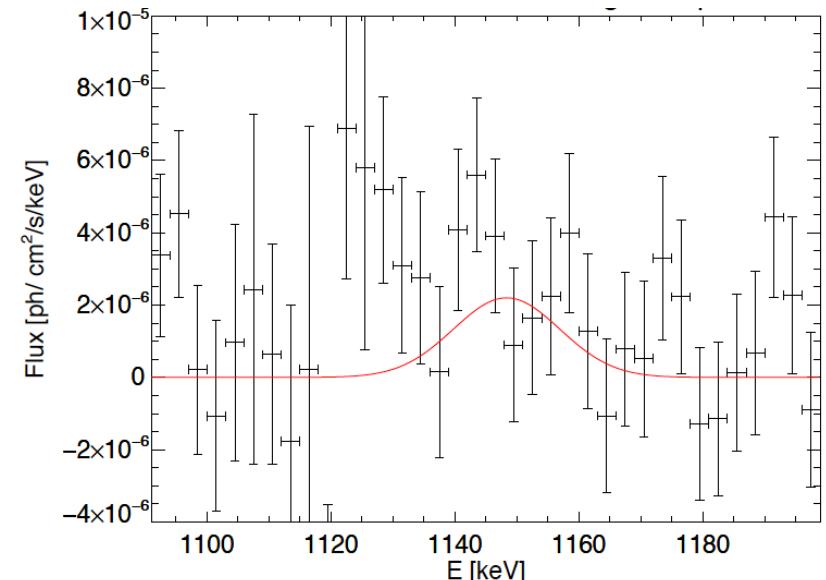

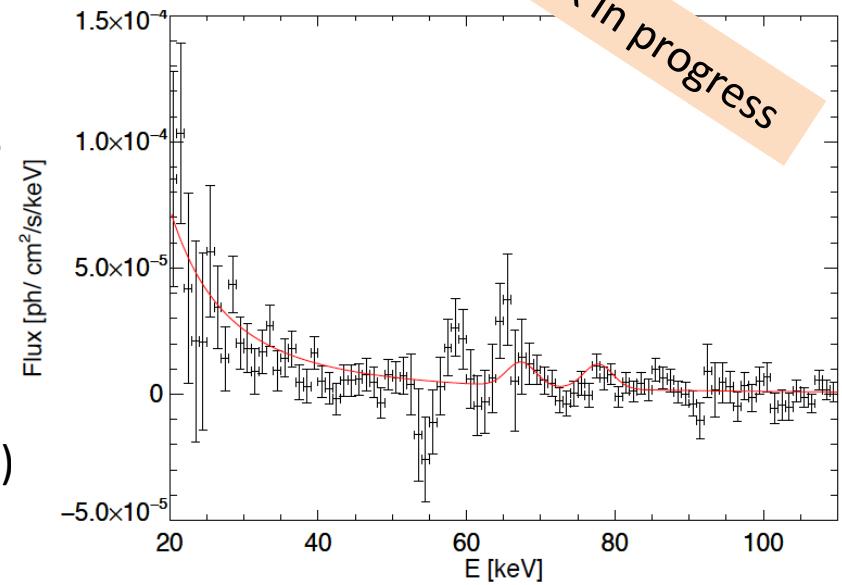

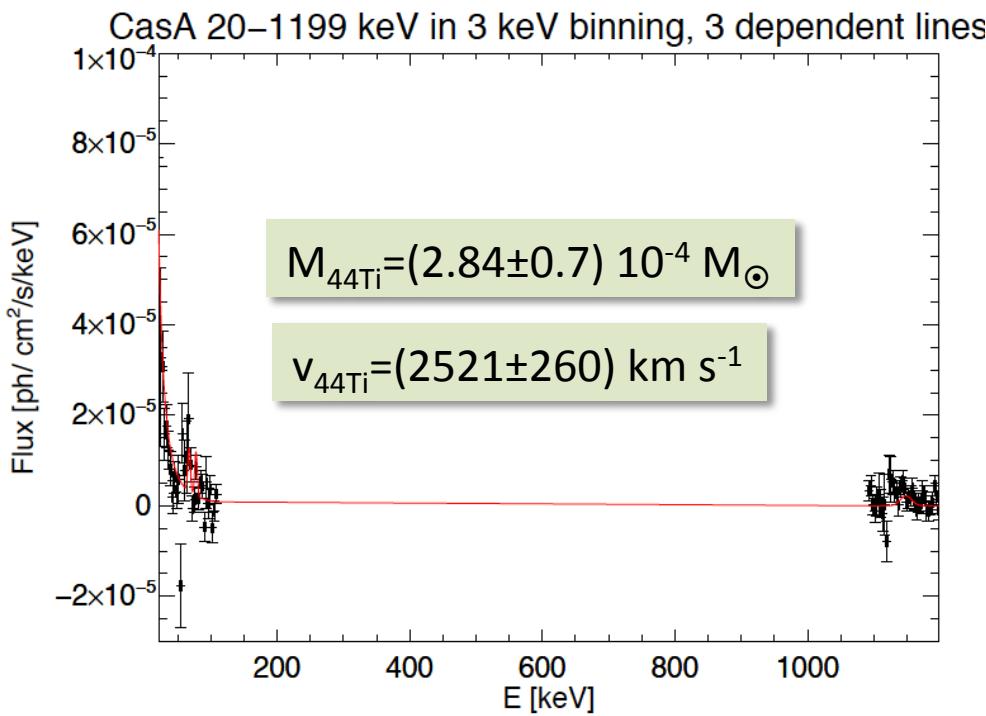

- Doppler broadening: $4300 \pm 1600 / 2200 \pm 1600 \text{ km s}^{-1}$ (78, 1157 keV)

Update: 3-line analysis

work in progress

- INTEGRAL Deep Exposure Program 2016-2017
 - » additionally 2 Msec of Cas A & Tycho region; currently: ~ 8.6 Ms
- Refined analysis (Weinberger+, preliminary)
 - » use templates for blended-lines background features
 - » constrain ^{44}Ti through 3-line set (one line amplitude + cont fitted)

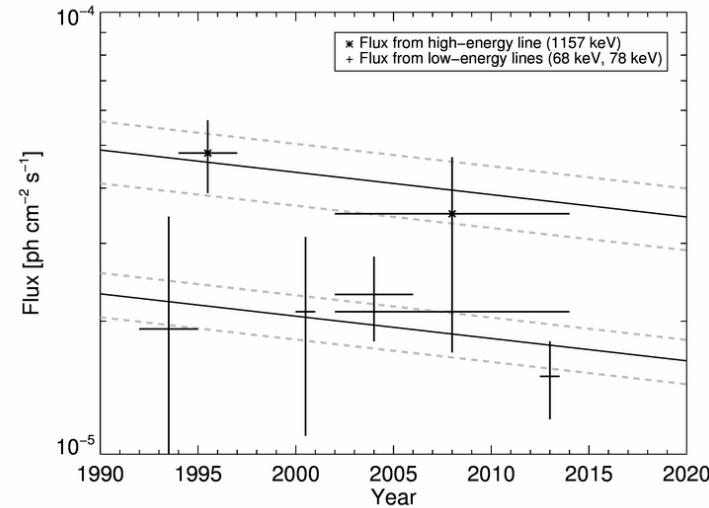

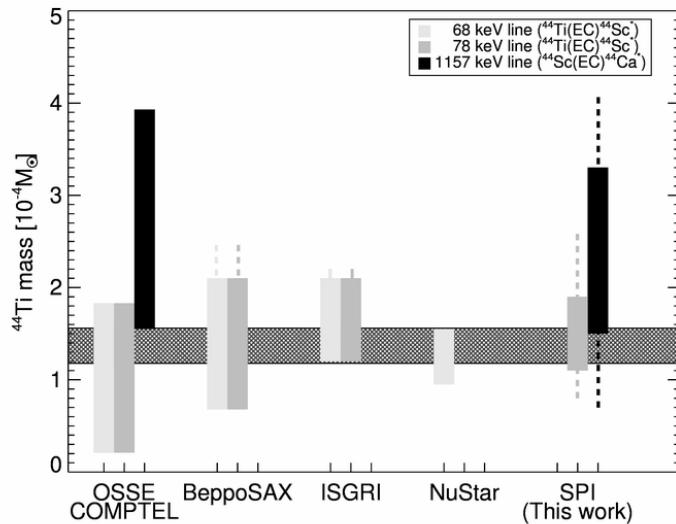

^{44}Ti from Cas A

- Consolidated Mass Determination:

- Different instruments & lines combined

Sieger et al. 2015

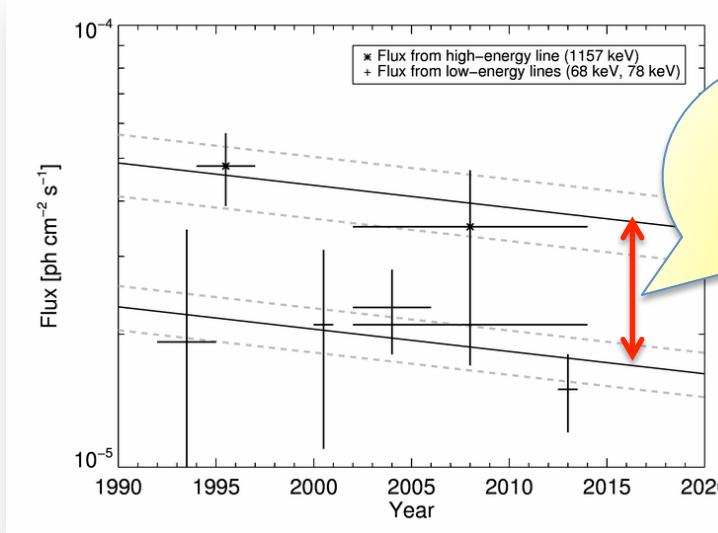

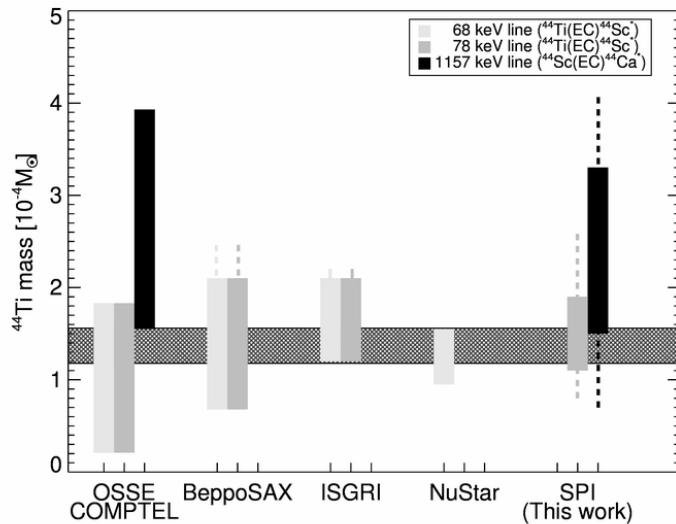

- ^{44}Ti mass = $(1.37 \pm 0.19) 10^{-4} M_{\odot}$ (all measurements)
 - ^{44}Ti mass = $(1.29 \pm 0.15) 10^{-4} M_{\odot}$ (78 keV line only)
 - ^{44}Ti mass = $(2.72 \pm 0.43) 10^{-4} M_{\odot}$ (1.157 MeV line only)

^{44}Ti from Cas A

- Consolidated Mass Determination:

- Different instruments & lines combined

Siegert et al. 2015

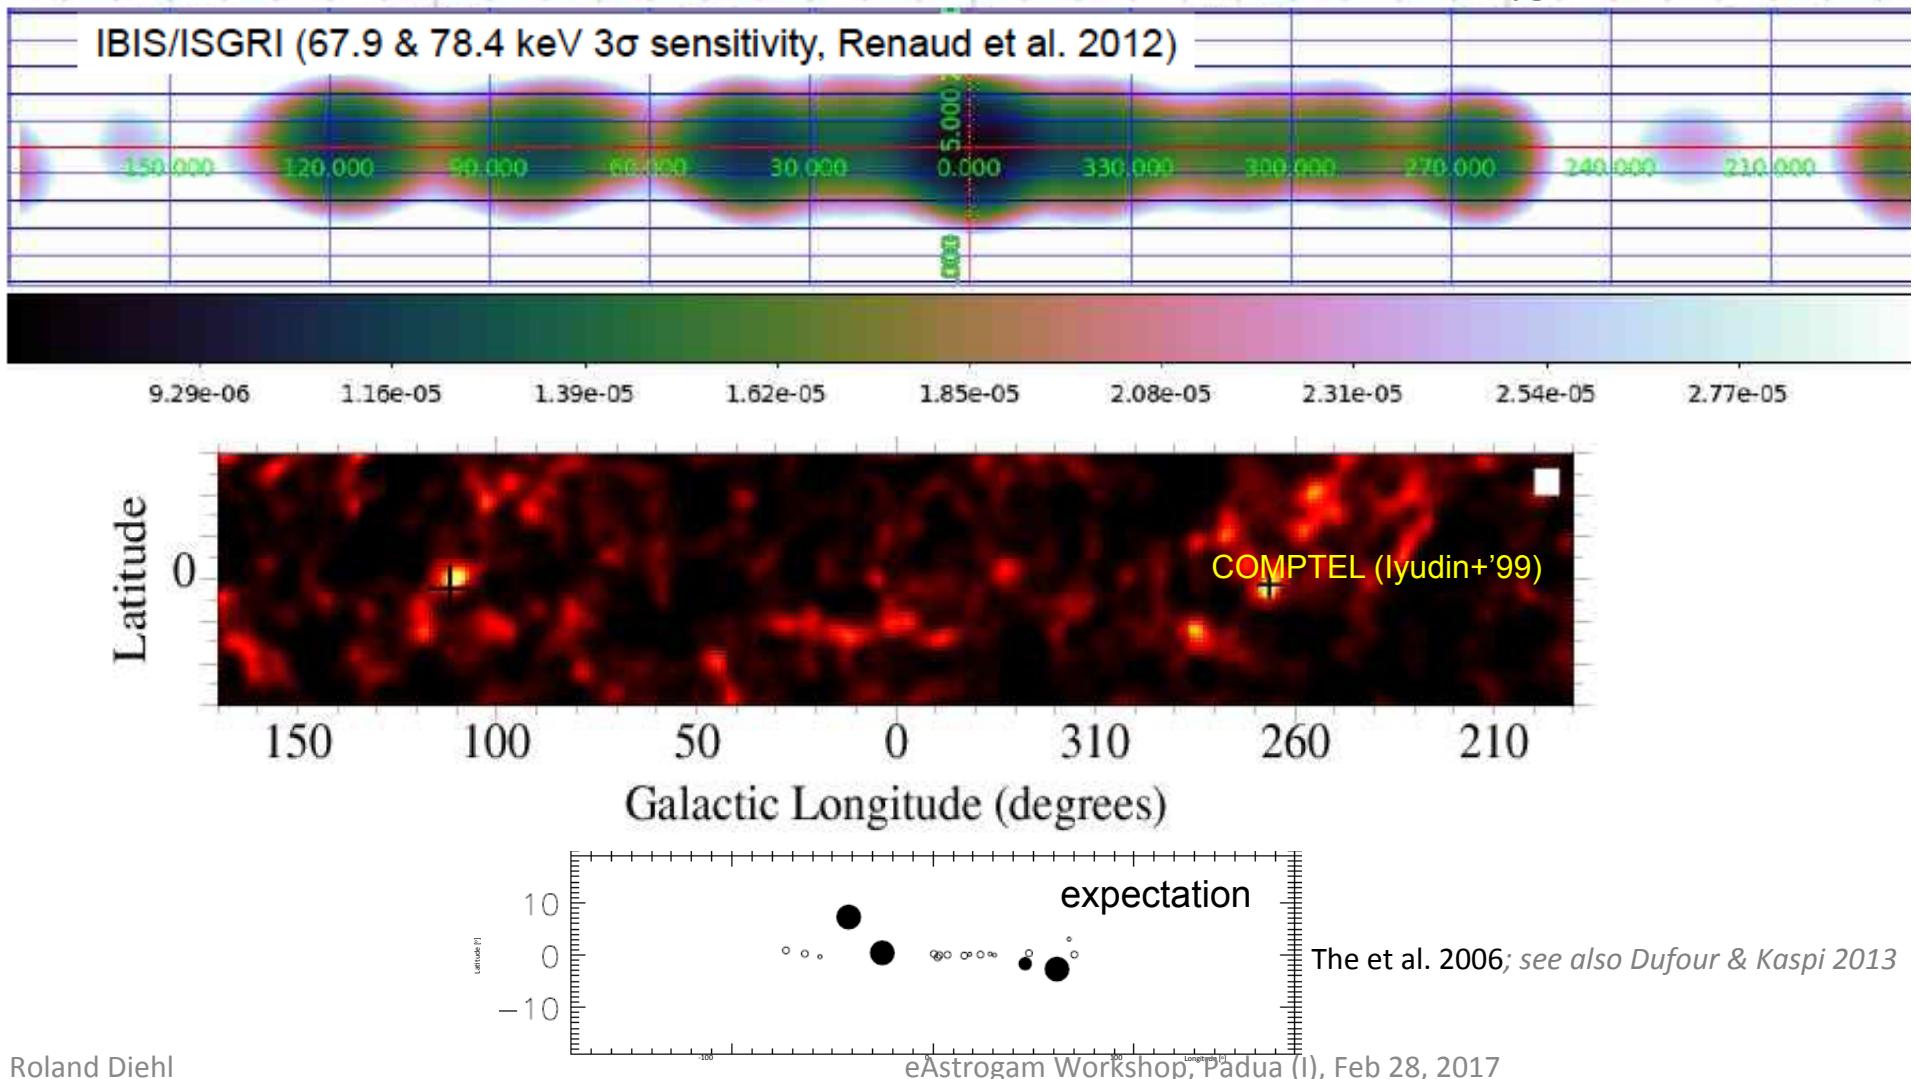

Enhanced
by particle
acceleration
In SNR?

- ^{44}Ti mass = $(1.37 \pm 0.19) 10^{-4} M_{\odot}$ (all measurements)
- ^{44}Ti mass = $(1.29 \pm 0.15) 10^{-4} M_{\odot}$ (78 keV line only)
- ^{44}Ti mass = $(2.72 \pm 0.43) 10^{-4} M_{\odot}$ (1.157 MeV line only)

Survey: Are all Core Collapse Supernovae ^{44}Ti Sources?

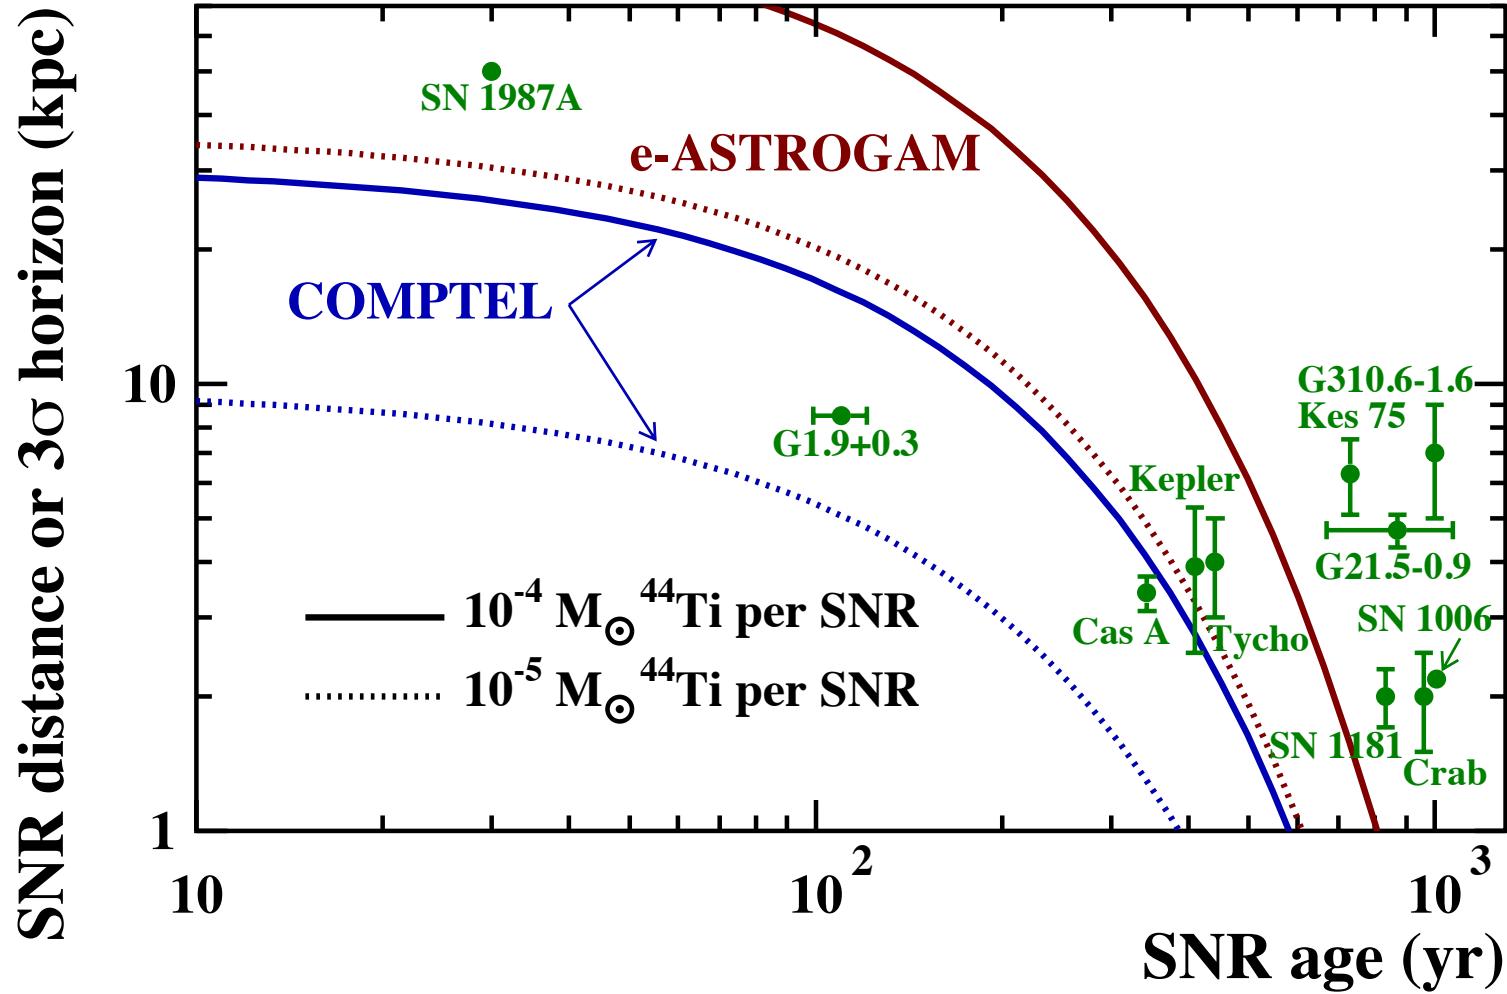

- ★ Cas A is the ONLY SNR Seen in our Galaxy – with $R_{\text{ccSN}} = 1.3 (\pm 0.4) / 100\text{y}$
- ★ Sky Regions with Most Massive Stars (inner Galaxy) are ^{44}Ti Source-Free
- ★ We would expect to see > a few of such sources!
