

# CERN Status and Future Plans

---

Arcetri, May 17th 2016

Sergio Bertolucci

INFN

# After LHC Run 1 (2010-2012):

---

- We have consolidated the Standard Model (a wealth of measurements at 7-8 TeV, including the rare, and very sensitive to New Physics,  $B_s \rightarrow \mu\mu$  decay)
- We have completed the Standard Model: discovery of the messenger of the BEH-field, the Higgs boson discovery
- We have found interesting properties of the hot dense matter
- **We have NO evidence of New Physics, although tantalizing hints have survived scrutiny**

# SM@LHC

## Standard Model Production Cross Section Measurements

Status: March 2014

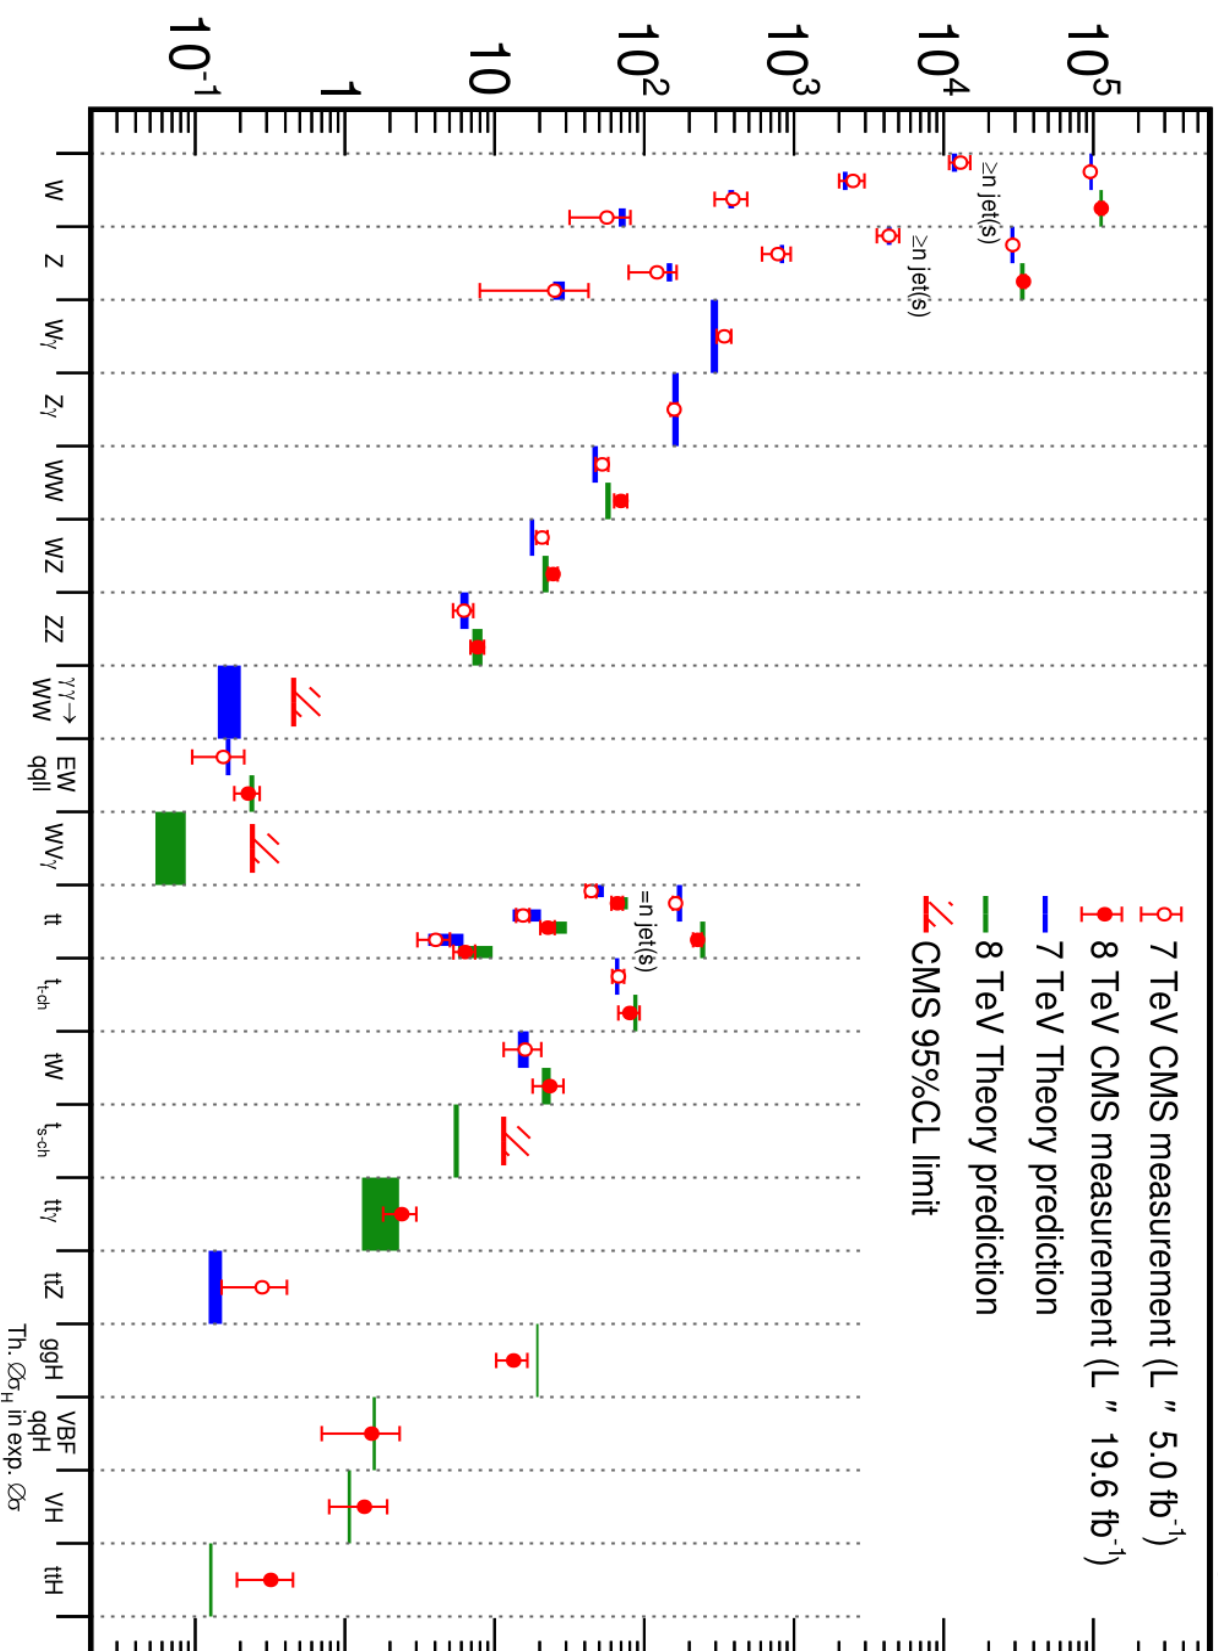

# SM@LHC

Feb 2014

CMS Preliminary

Production Cross Section,  $\sigma$  [pb]

# Higgs Combination

- Five main decay channels all published
- Combination submitted Dec 30**
- All results consistent with SM Higgs

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/Hig14009PaperTwiki>

$m_H = 125.02^{+0.26}_{-0.27} \text{ (stat.) }^{+0.14}_{-0.15} \text{ (syst.) GeV}$

$\mu = 1.00^{+0.14}_{-0.13} [\pm 0.09 \text{ (stat.) }^{+0.08}_{-0.07} \text{ (theo.) } \pm 0.07 \text{ (syst.)}]$

Jim Olsen - LHCC Open Session

Channel	Obs ( $\sigma$ )	Exp ( $\sigma$ )
H $\rightarrow$ ZZ	6.5	6.3
H $\rightarrow$ $\gamma\gamma$	5.6	5.3
H $\rightarrow$ WW	4.7	5.4
H $\rightarrow$ $\tau\tau$	3.8	3.9
H $\rightarrow$ bb	2.0	2.6
H $\rightarrow$ $\mu\mu$	< 0.1	0.4

# Higgs production, rates, couplings

ATLAS-CONF-2015-007

## Combination of most channels

Measurement of coupling strengths in a variety of models, with varying levels of model dependence (assumptions)

Most generic model, measure ratios of coupling strengths

$\kappa_{gZ} = 1.18 \pm 0.16$   
 $\lambda_{g\gamma} = 1.09^{+0.26}_{-0.22}$   
 $\lambda_{WZ} \in [-1.04, -0.81]$   
 $\mu[0.80, 1.06]$   
 $\lambda_{g\gamma} \in [-1.70, -1.07]$   
 $\mu[1.03, 1.73]$   
 $\lambda_{gZ} = 0.60 \pm 0.27$   
 $\lambda_{Z\gamma} = 0.99^{+0.23}_{-0.19}$   
(95% CL)  $\lambda_{WZ} < 2.3$   
 $\lambda_{Z\gamma} = 0.90 \pm 0.15$   
(95% CL)  $\lambda_{1,2\gamma Z} < 3.2$

→ consistency with SM

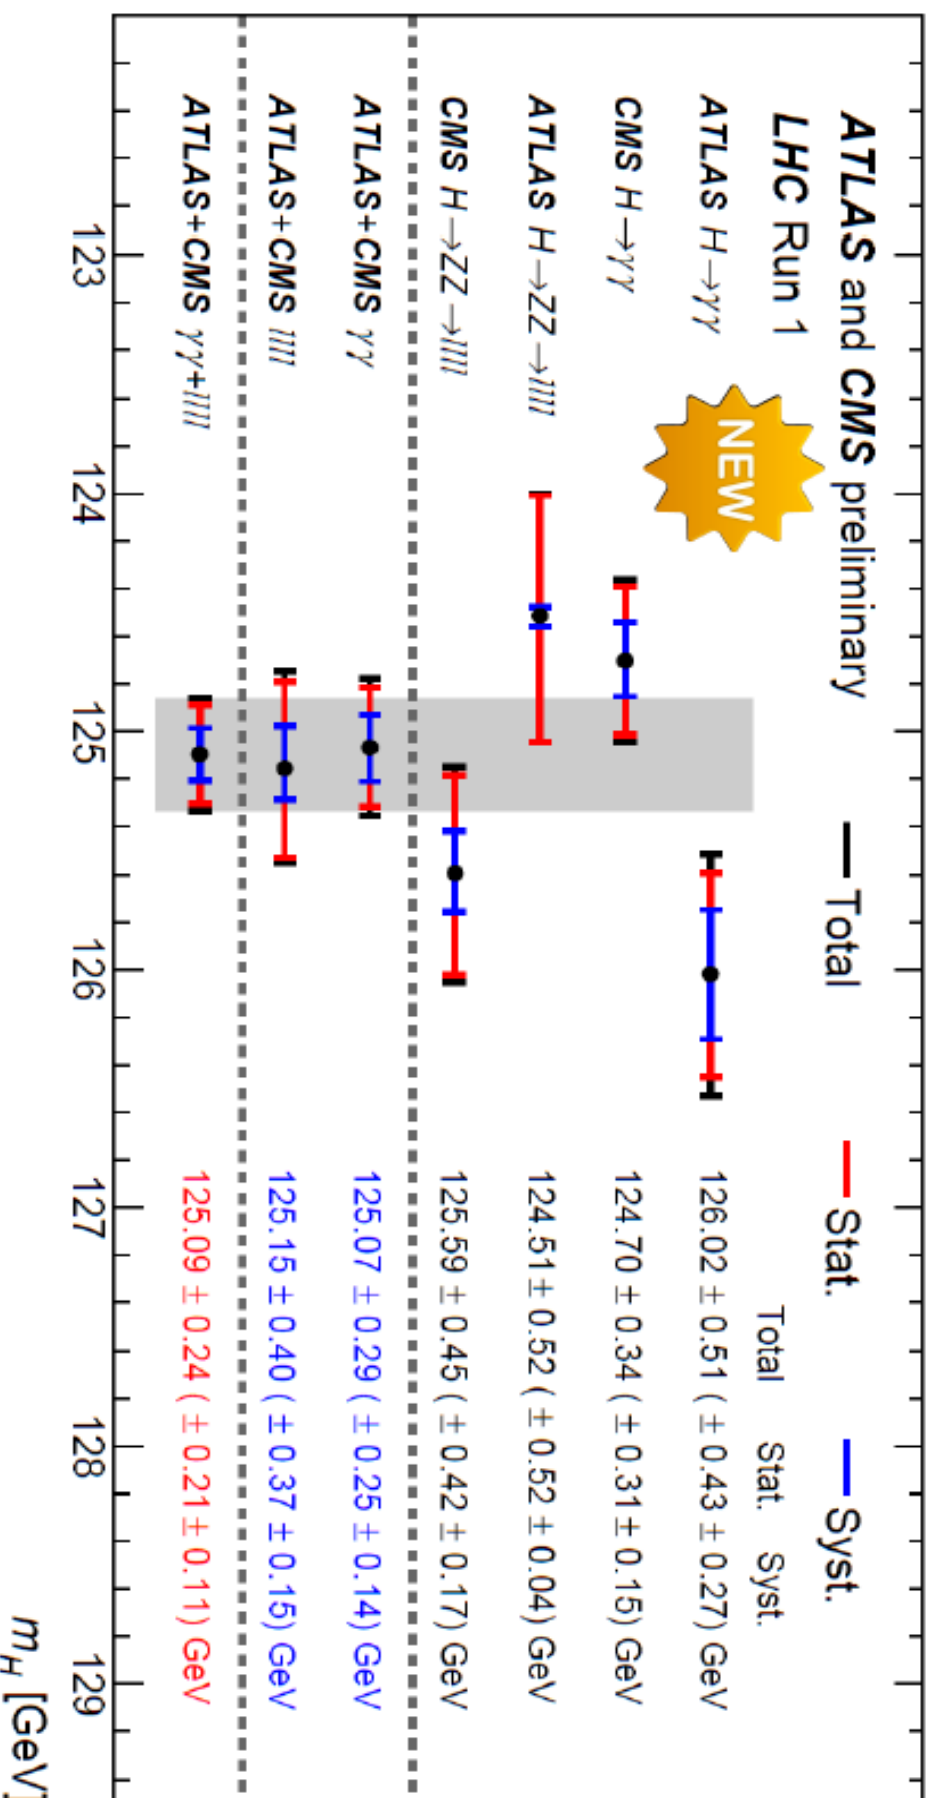

VBF invisible Higgs search (ATLAS-CONF-2015-004):  
 $BR(H \rightarrow \text{invis.}) < 29\%$  (obs.) and  $< 35\%$  (exp.) at 95% CL.

# ATLAS+CMS Higgs mass combination

... and the ATLAS+CMS combined Higgs boson mass is:

$$m_H = 125.09 \pm 0.24 \text{ GeV} \text{ (0.19\% precision!)} \\ = 125.09 \pm 0.21(\text{stat.}) \pm 0.11(\text{syst.}) \text{ GeV}$$

# Run-1 SUSY program completing

\*Only a selection of the available mass limits on new states or phenomena is shown. All limits quoted are observed minus 1 $\sigma$  theoretical signal cross section uncertainty.

# CMS and LHCb $B^0_{s,d} \rightarrow \mu \mu$ combination

Fit to full run I data sets of both experiments, sharing parameters

Result demonstrates power of combining data from >1 experiment (an LHC first!)

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = 2.8^{+0.7}_{-0.6} \times 10^{-9}$$

6.2  $\sigma$  for the  $B_s^0 \rightarrow \mu^+ \mu^-$   
(Expected SM 7.6  $\sigma$ )

◆ First observation

projection of invariant mass in most sensitive bins

# Where we stand

---

- We have exhausted the number of “known unknowns” within the current paradigm.
- Although the SM enjoys an enviable state of health, we know it is incomplete, because it cannot explain several outstanding questions, supported in most cases by experimental observations.

# Looking for “unknown unknowns”

Needs a synergic use of:

- High-Energy colliders
- neutrino experiments (solar, short/long baseline, reactors,  $0\nu\beta\beta$  decays),
- cosmic surveys (CMB, Supernovae, BAO, Dark E)
- gravitational waves
- dark matter direct and indirect detection
- precision measurements of rare decays and phenomena
- dedicated searches (WIMPS, axions, dark-sector particles)
- .....

# From the Update of the European Strategy for Particle Physics

---

The success of the LHC is proof of the effectiveness of the European organizational model for particle physics, founded on the sustained long-term commitment of the CERN Member States and of the national institutes, laboratories and universities closely collaborating with CERN.

**Europe should preserve this model in order to keep its leading role,** sustaining the success of particle physics and the benefits it brings to the wider society.

The scale of the facilities required by particle physics is **resulting in the globalization of the field.** The European Strategy takes into account the worldwide particle physics landscape and developments in related fields and should continue to do so.

# From the P5 report

---

## **Particle physics is global.**

The United States and major players in other regions can together address the full breadth of the field's most urgent scientific questions **if each hosts a unique world-class facility at home and partners in high-priority facilities hosted elsewhere.**

Strong foundations of international cooperation exist, with the Large Hadron Collider (LHC) at CERN serving as an example of a successful large international science project.

**Reliable partnerships are essential for the success of international projects.** Building further international cooperation is an important theme of this report, and this perspective is finding worldwide resonance in an intensely competitive field.

# From Japan HEP Community

---

The committee makes the following recommendations concerning large-scale projects, which comprise the core of future high energy physics research in Japan.

Should a new particle such as a Higgs boson with a mass below approximately 1 TeV be confirmed at LHC, **Japan should take the leadership role in an early realization of an e<sup>+</sup>e<sup>-</sup> linear collider**. In particular, if the particle is light, experiments at low collision energy should be started at the earliest possible time. In parallel, continuous studies on new physics should be pursued for both LHC and the upgraded LHC version. Should the energy scale of new particles/physics be higher, accelerator R&D should be strengthened in order to realize the necessary collision energy.

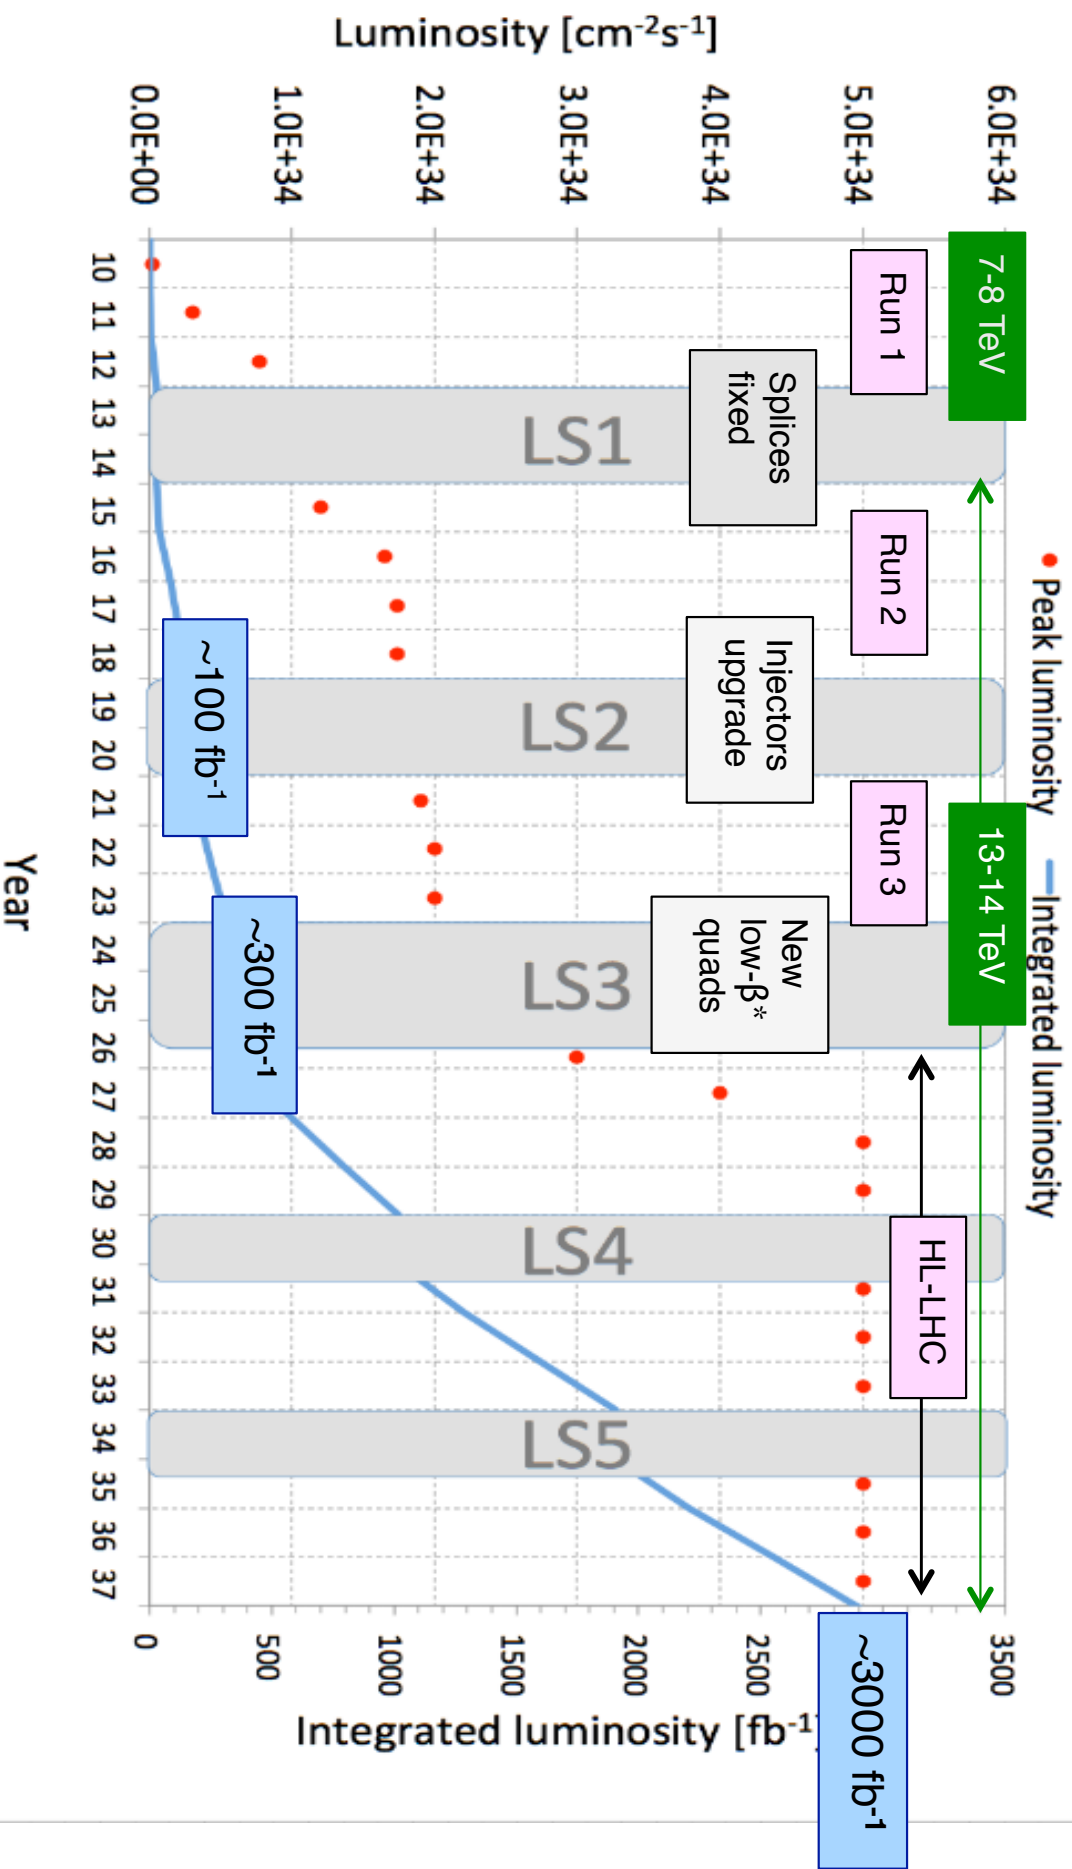

Should the neutrino mixing angle  $\theta_{13}$  be confirmed as large, **Japan should aim to realize a large-scale neutrino detector through international cooperation**, accompanied by the necessary reinforcement of accelerator intensity, so allowing studies on CP symmetry through neutrino oscillations.

This new large-scale neutrino detector should have sufficient sensitivity to allow the search for proton decays, which would be direct evidence of Grand Unified Theories.

# The LHC timeline

# Where is New Physics?

---

## The question

- Is the mass scale beyond the LHC reach ?
- Is the mass scale within LHC's reach, but final states are elusive ?

We should be prepared to exploit both scenarios, through:

- Precision
- Sensitivity (to elusive signatures)
- Extended energy/mass reach

# Extending the reach...

- Weak boson scattering
- Higgs properties
- Supersymmetry searches and measurements
- Exotics
- $t$  properties
- Rare decays
- CPV
- ..etc

# 13 TeV vs 8 TeV

Ratio of 13 TeV / 8 TeV

Cross sections:

- $Z'$  at 3 TeV: 20
- $q^*$  at 4 TeV: 56
- QBH at 5 TeV: 370
- QBH at 6 TeV: 9000

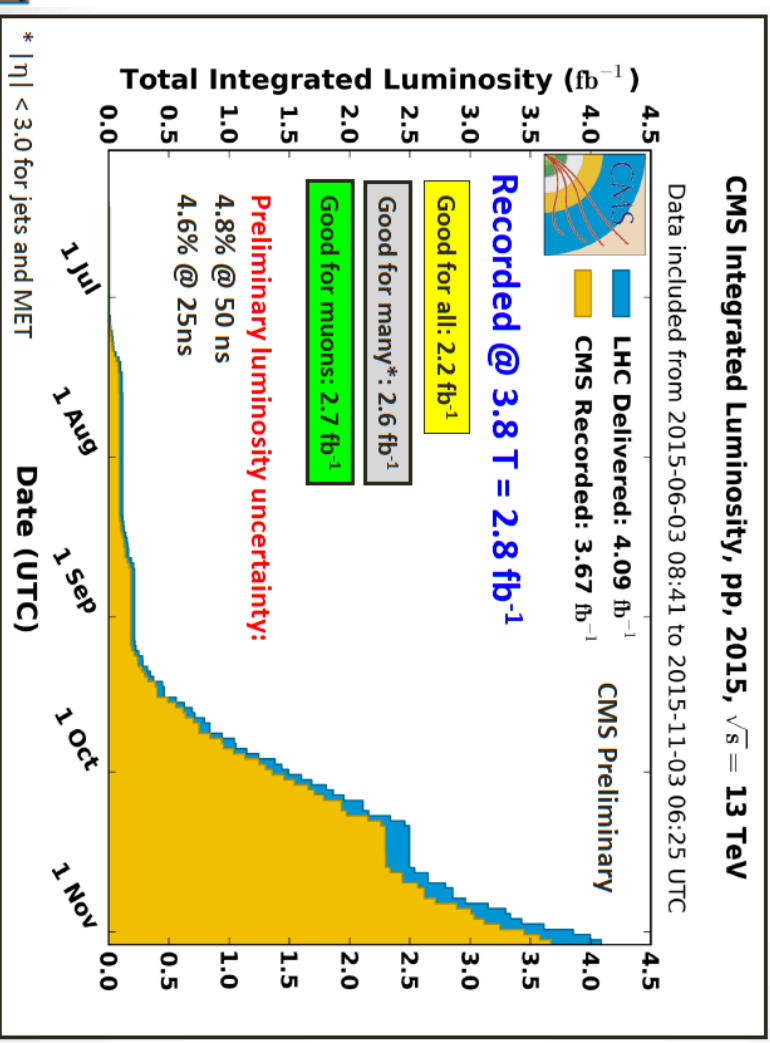

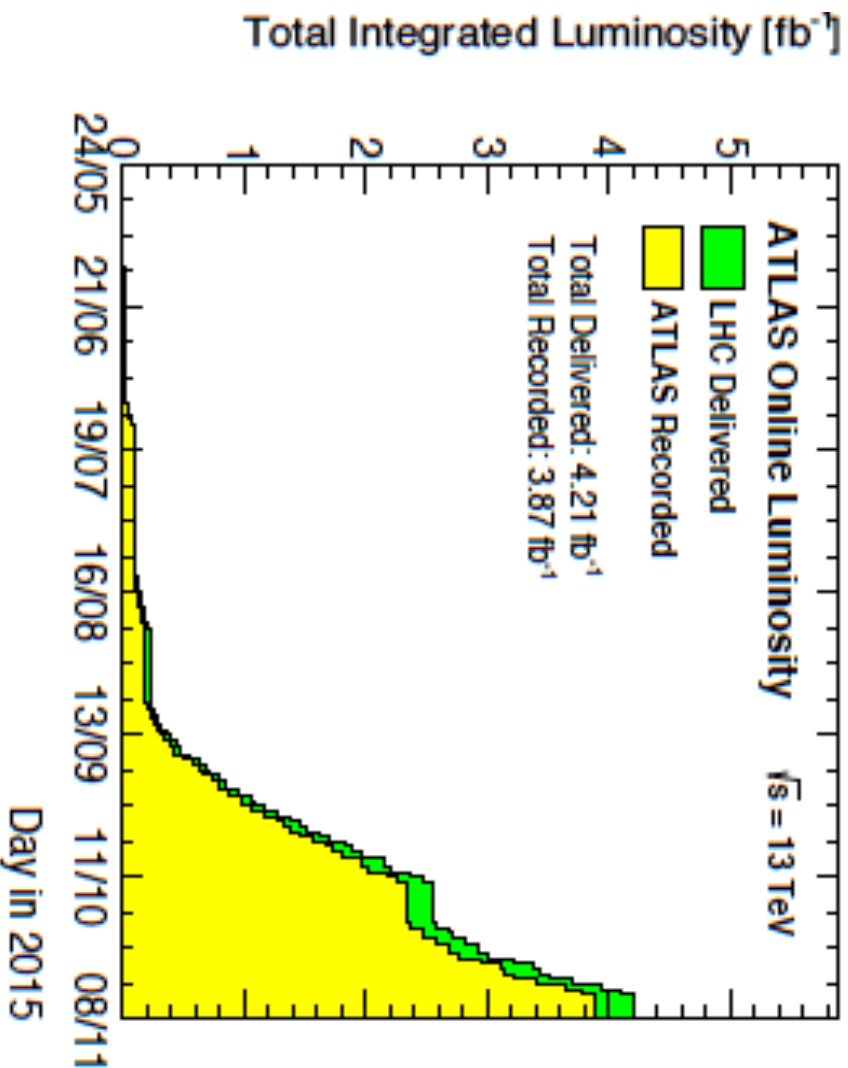

# The main 2013-14 LHC consolidations

# Run2 @ 13 TeV in 2015

- Experiments in good shape (except for cryo problem with CMS solenoid)
- $\sim 4 \text{ pb}^{-1}$  collected

# The tantalizing diphotons: ATLAS

[ATLAS-CONF-2015-081](#)

## Search for a Two Photons Resonance (I)

### Inclusive search for two photon resonance

(optimized for a scalar resonance)

- Selection of two photons with pT/m thresholds of 0.3 and 0.4 and pT dependent calorimeter and track isolation criteria
- Typical prompt photon purity 90%

### Background from a functional

Similar to the dijet search but chosen using the Fisher F-test and the spurious signal method measured in events from Sherpa, Diphoton and Jetphox:

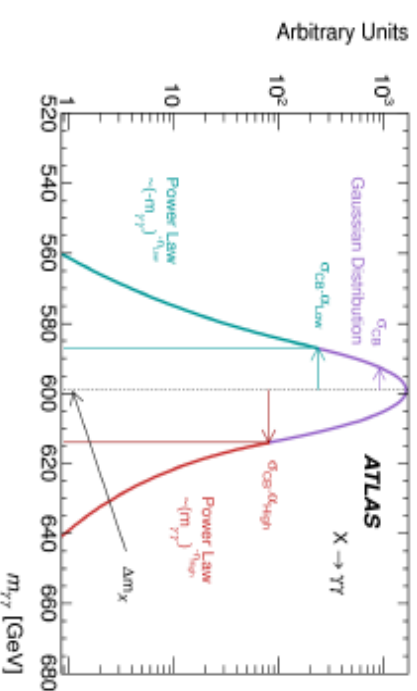

$$f_{bkg}(x; b, \{a_k\}) = (1 - x^{1/3})^b x^{\sum_{j=0}^k a_j \log(x)^j}$$

$$x \equiv \frac{m_{\gamma\gamma}}{\sqrt{s}}$$

Here a simple form  
with  $k=0$  is used

### Signal Model

- NWA: Use Double Sided Crystal Ball function
- LW: Use DSCB fitted from simulated samples with different widths with up to 25% of the resonance mass

# The tantalizing diphotons: ATLAS

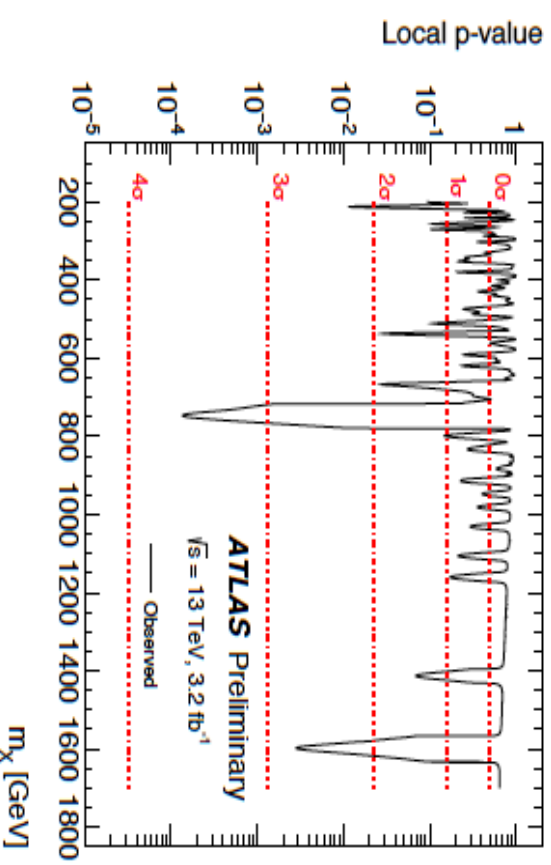

## Search for a Two Photons Resonance (II)

Results: Events with mass in excess of 200 GeV are included in unblinded fit

- In the NWA search, an excess of  $3.6\sigma$  (local) is observed at a mass hypothesis of minimal  $p_0$  of 750 GeV

- Taking a LEE in a mass range (fixed before unblinding) of 200 GeV to 2.0 TeV the global significance of the excess is  $2.0\sigma$

In the NWA fit the resolution uncertainty is profiled in the NWA fit and is pulled by  $1.5\sigma$

The data was then fit under a LW hypothesis yielding a width of approximately 45 GeV

(Approx. 6% of the best fit mass of approximately 750 GeV)

- As expected the local significance increases to  $3.9\sigma$
- Taking into account a LEE in mass and width of up to  $10\%$  of the mass hypothesis of  $2.3\sigma$  (Note: upper range in resolution fixed after unblinding)

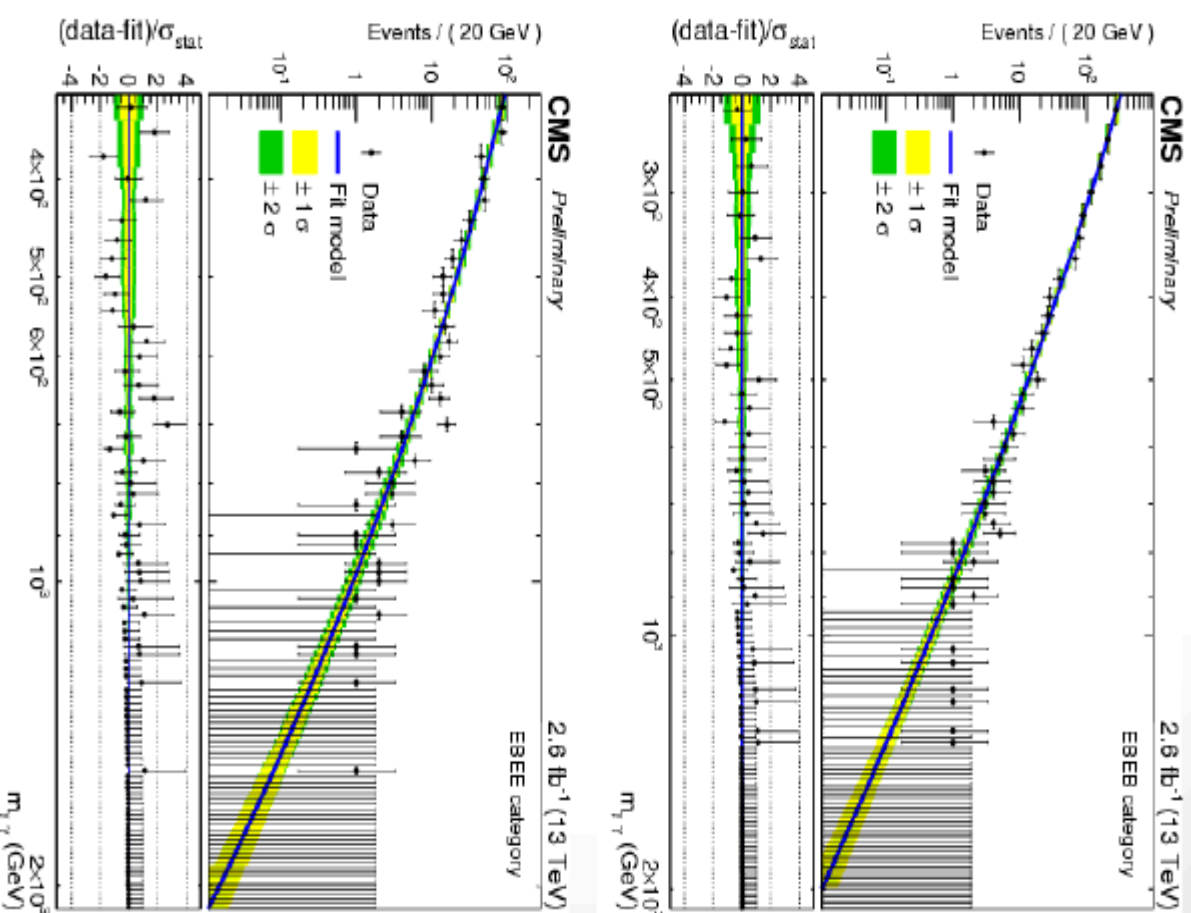

# ...and CMS

## Search for diphoton resonances

EXO-15-004

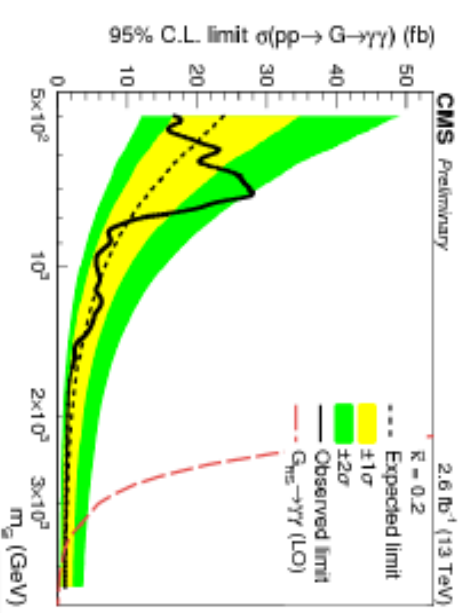

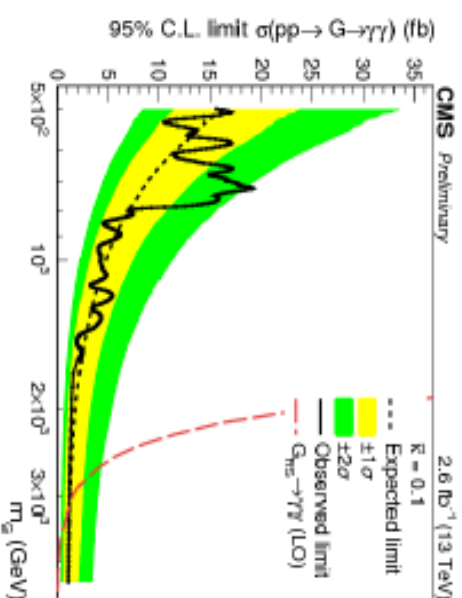

- Two categories: **barrel-barrel (EBEB)**, **barrel-endcap (EBEE)**
- $p_T(\gamma) > 75 \text{ GeV}$ ,  $l_{ch} < 5 \text{ GeV}$  (in 0.3 cone around photon direction)
- Efficiency, scale and resolution calibrated on  $Z \rightarrow ee$  and high-mass DY events
- Search for RS graviton with three assumptions on coupling:  
 $\tilde{\kappa} = 0.01$  (narrow), 0.1, 0.2 (wide)
- Blind analysis, no changes have been made to the analysis since unblinding data in the signal region**

# ...and CMS

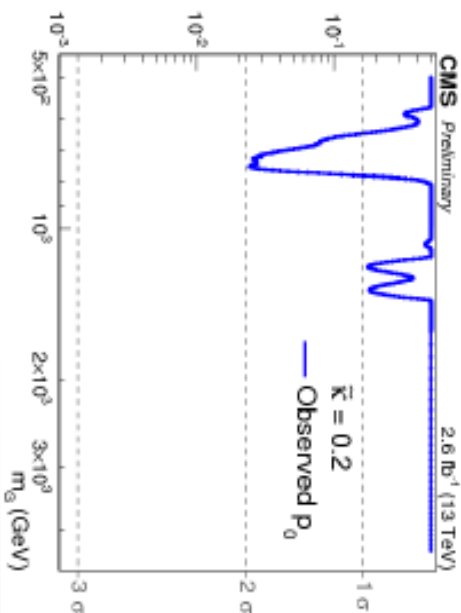

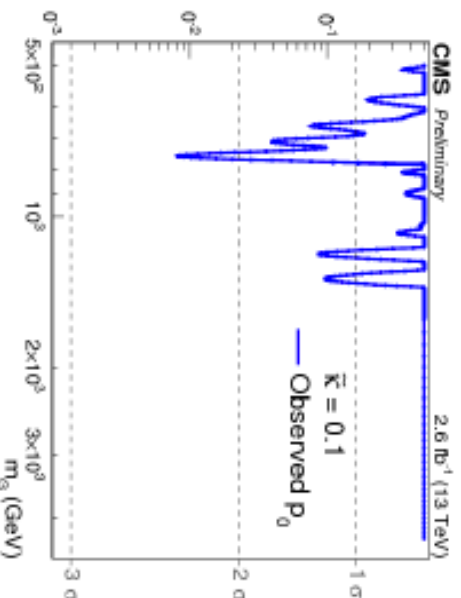

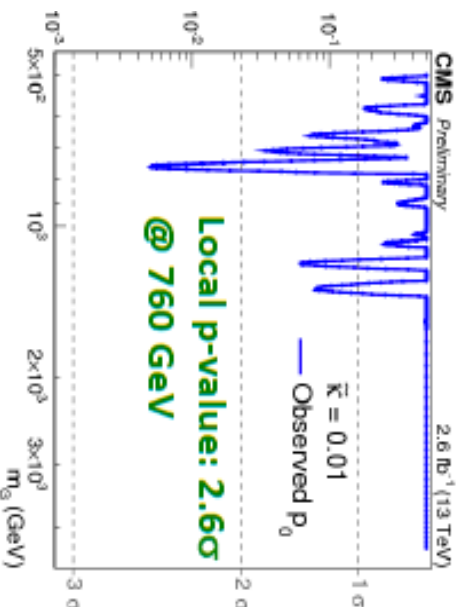

EXO-15-004

## Combined limits and p-values

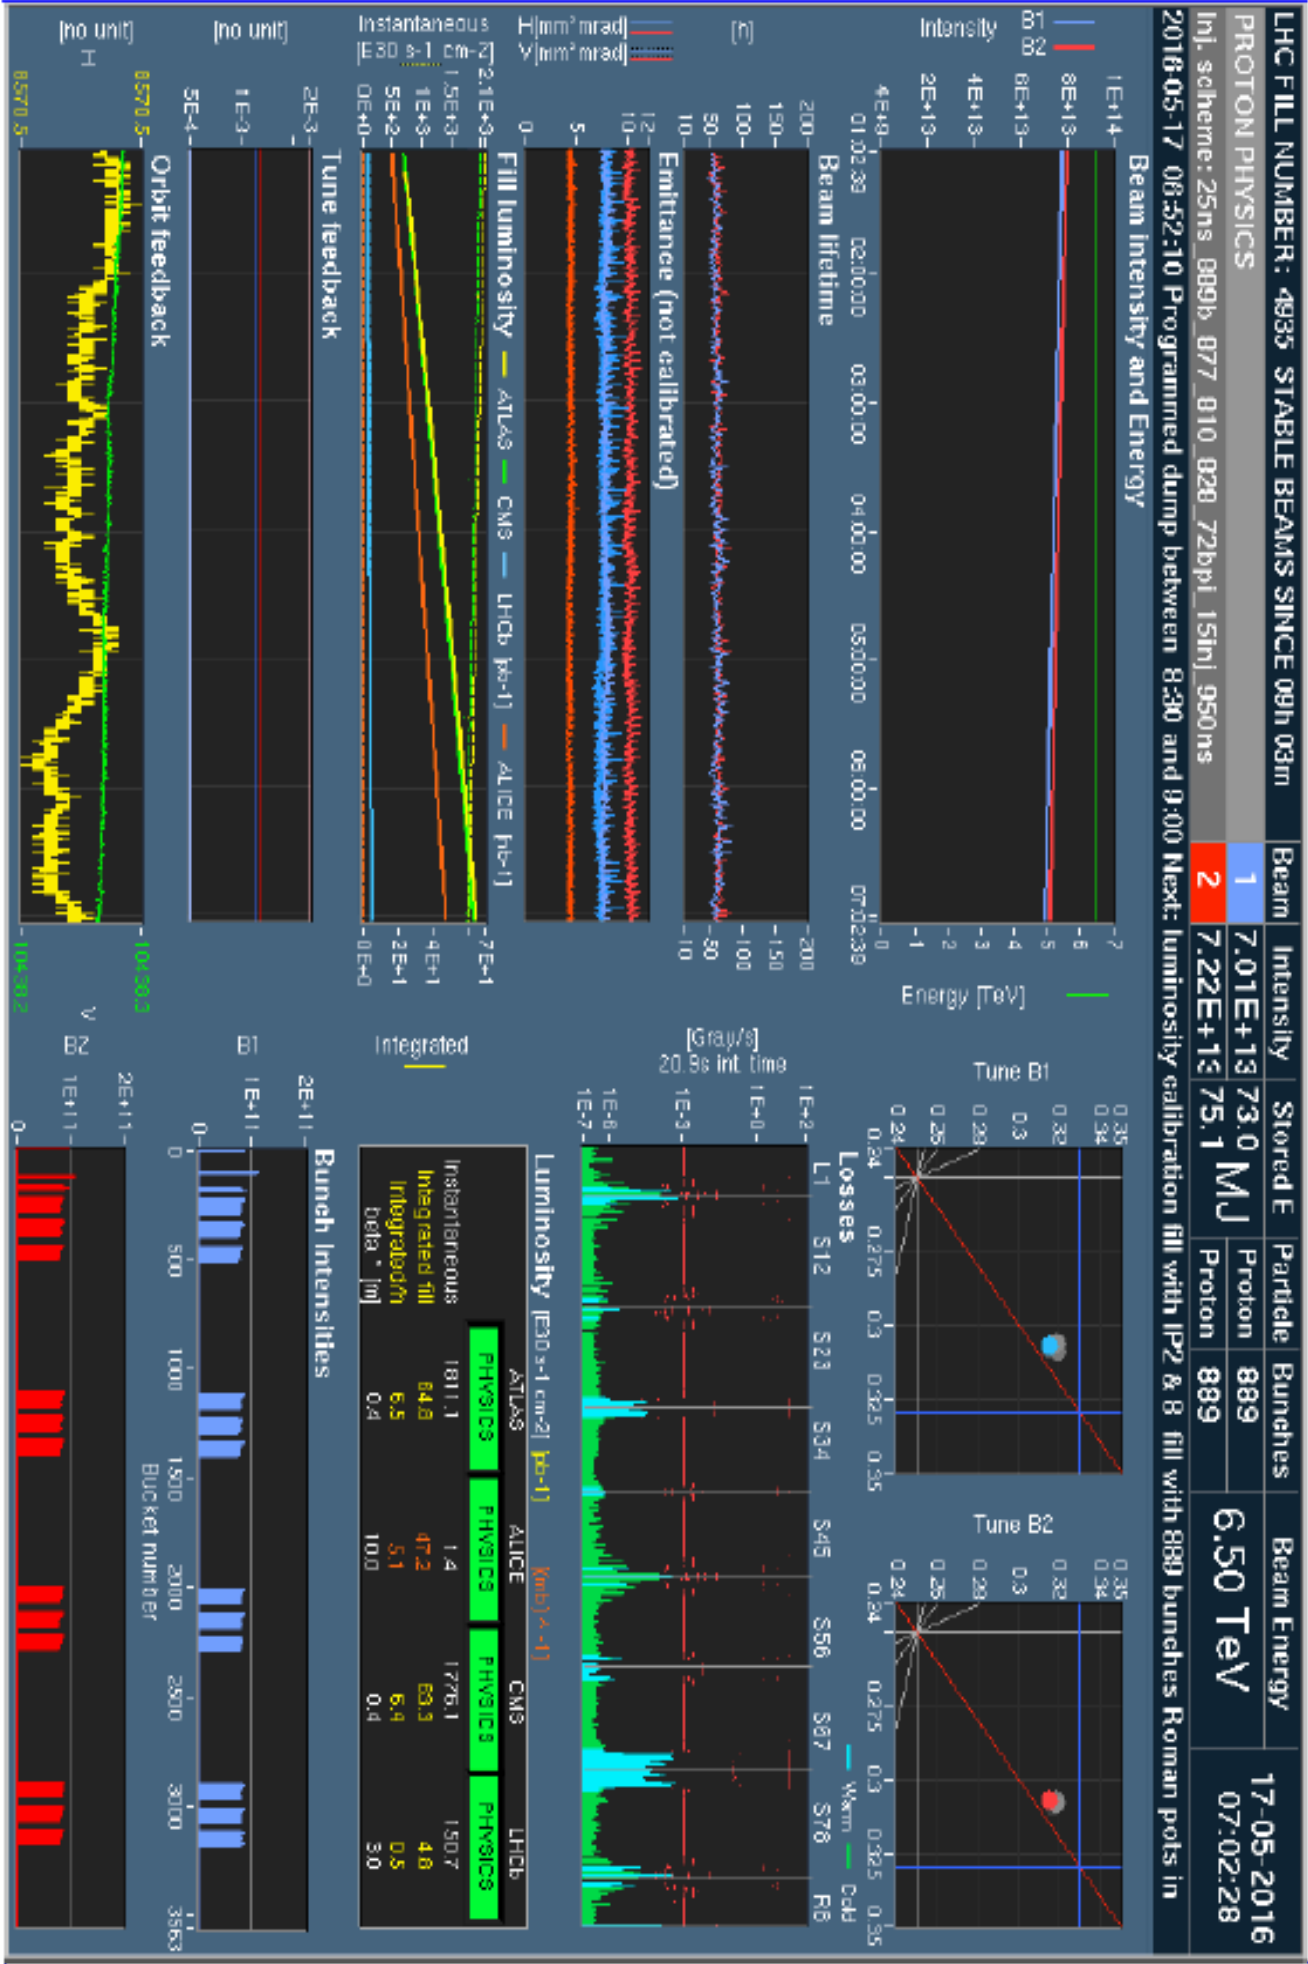

Narrow Width

Wide (6%) Width

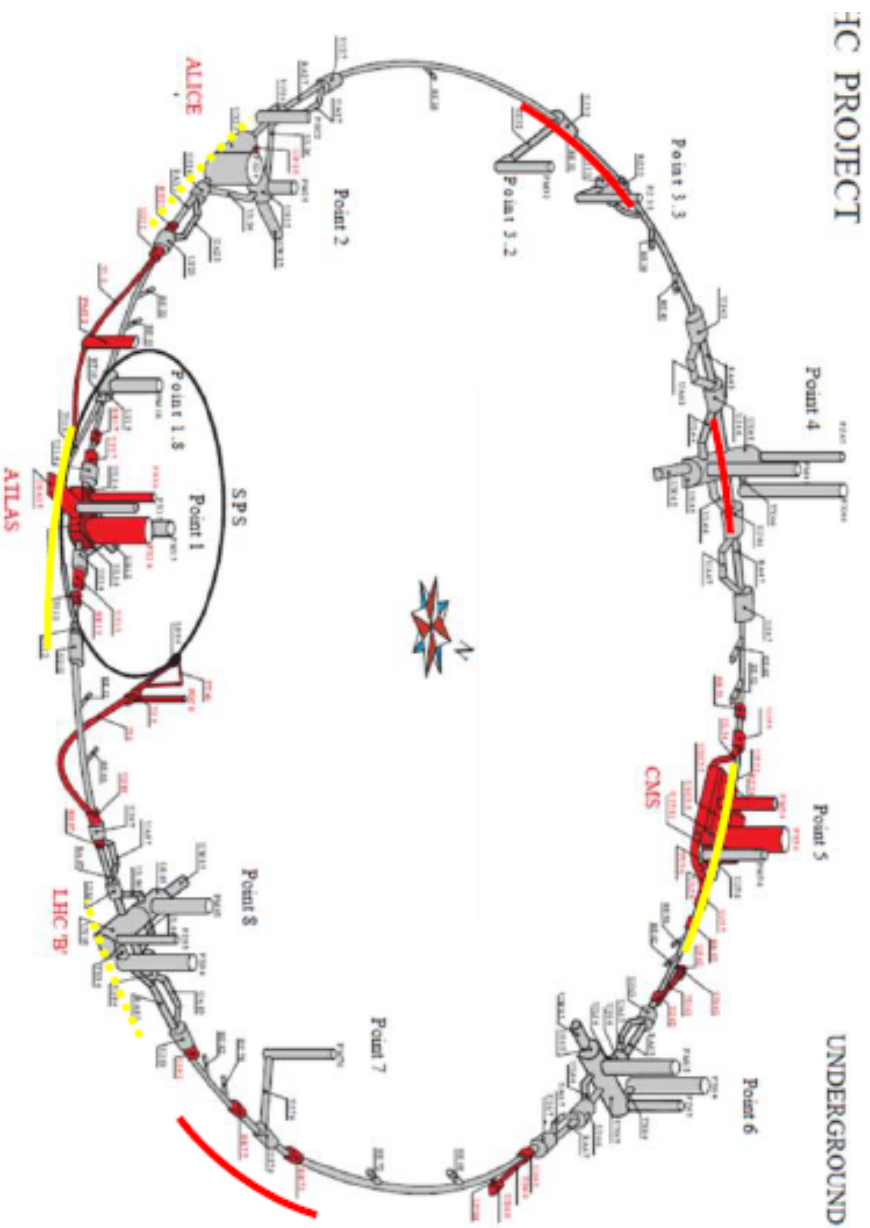

Including LEE (0.5 - 4.5 TeV; narrow width), global p-value < 1.2 $\sigma$

Only time will tell...

# The HL-LHC Project

- New IR-quads  $\text{Nb}_3\text{Sn}$  (inner triplets)
- New 11 T  $\text{Nb}_3\text{Sn}$  (short) dipoles
- Collimation upgrade
- Cryogenics upgrade
- Crab Cavities
- Cold powering
- Machine protection
- ...

**Major intervention on more than 1.2 km of the LHC**  
**Project leadership: L. Rossi and O. Brüning**

# Higgs couplings fit at HL-LHC

Coupling	Uncertainty (%)			
	300 fb <sup>-1</sup>		3000 fb <sup>-1</sup>	
	Scenario 1	Scenario 2	Scenario 1	Scenario 2
$\kappa_\gamma$	6.5	5.1	5.4	1.5
$\kappa_V$	5.7	2.7	4.5	1.0
$\kappa_g$	11	5.7	7.5	2.7
$\kappa_b$	15	6.9	11	2.7
$\kappa_t$	14	8.7	8.0	3.9
$\kappa_\tau$	8.5	5.1	5.4	2.0

## CMS

### CMS Projection

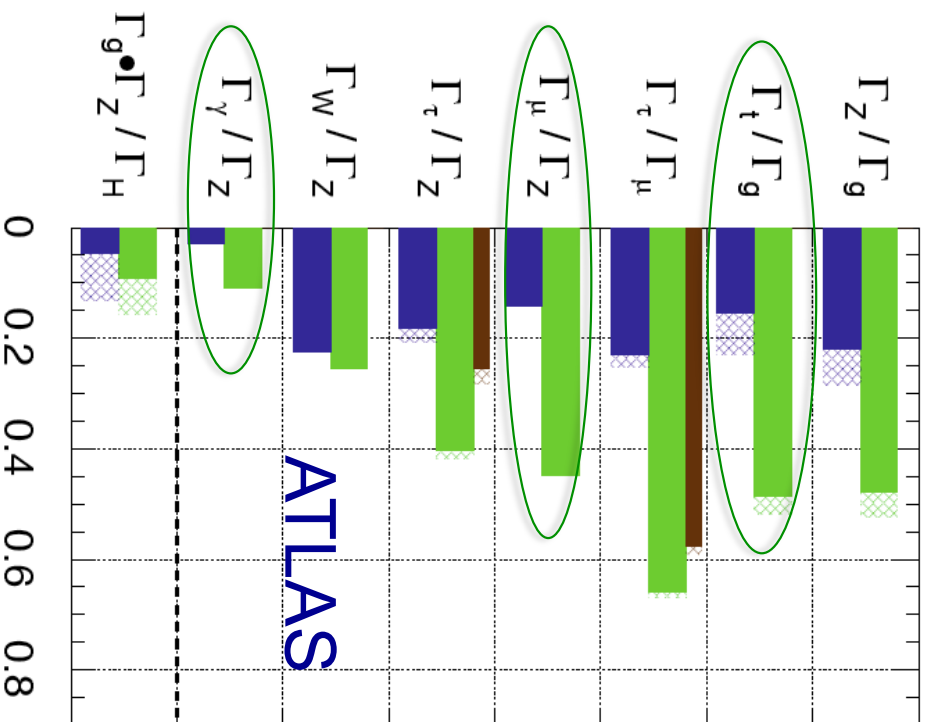

**Assumption NO invisible/undetectable** contribution to  $\Gamma_H$ :

- **Scenario 1**: system./Theory err. **unchanged** w.r.t. current analysis
- Scenario 2: **systematics** scaled by  $1/\sqrt{L}$ , **theory errors** scaled by  $1/2$
- ✓  $\gamma\gamma$  loop at 2-5% level
- ✓ **down-type fermion** couplings at 2-10% level
- ✓ direct **top** coupling at 4-8% level
- ✓  $gg$  loop at 3-8% level

# Coupling Ratios Fit at HL-LHC

$\sqrt{s} = 14 \text{ TeV}$ :  $\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  ;  $\int \mathcal{L} dt = 3000 \text{ fb}^{-1}$

$\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  extrapolated from 7+8 TeV

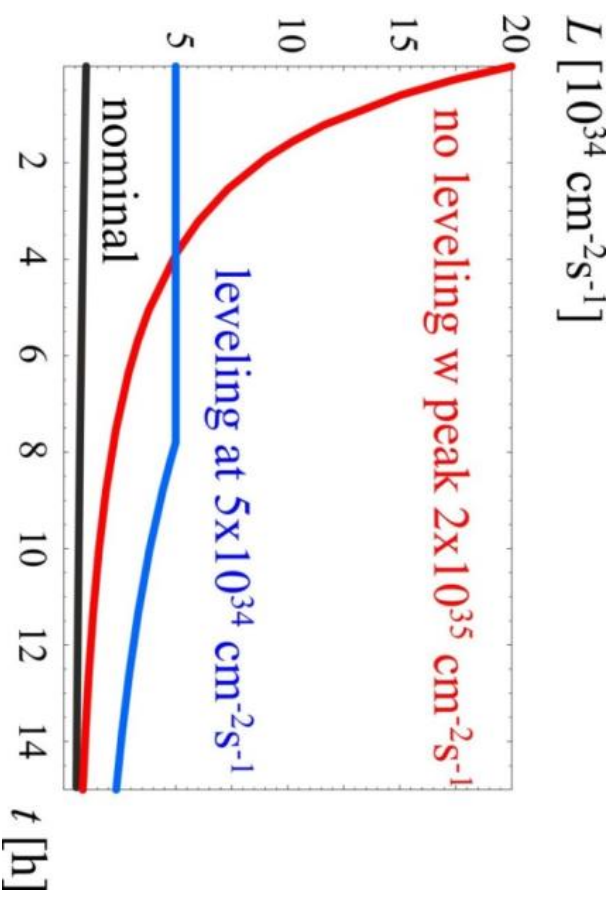

- Fit to coupling ratios:
  - No assumption **BSM** contributions to  $\Gamma_H$
  - Some theory systematics cancels in the ratios
- **Loop-induced** Couplings  $\gamma\gamma$  and  $gg$  treated as independent parameter
  - $\kappa_{\gamma}/\kappa_Z$  tested at **2%**
  - $gg$  loop (**BSM**)  $\kappa_t/\kappa_g$  at **7-12%**
  - 2<sup>nd</sup> generation term.  $\kappa_{\mu}/\kappa_Z$  at **8%**

# Extending the reach....

# Luminosity Levelling, a key to success

- Obtain about 3 - 4  $\text{fb}^{-1}/\text{day}$  (40% stable beams)
- About 250 to 300  $\text{fb}^{-1}/\text{year}$

■ High peak luminosity  
■ Minimize pile-up in experiments and provide “constant” luminosity

# Baseline parameters of HL for reaching 250 -300 fb<sup>-1</sup>/year

**25 ns is the option**  
However:  
50 ns should be kept as alive and possible because we DO NOT have enough experience on the actual limit (*e-clouds, I<sub>beam</sub>*)

## Continuous global optimisation with LIU

# The detectors challenge

7 – 11 orders of magnitude between inelastic and “interesting” - “discovery” physics event rate

# The detectors challenge

---

In order to exploit the LHC potential, experiments have to maintain full sensitivity for discovery, while keeping their capabilities to perform precision measurements at low  $p_T$ , in the presence of:

- Pileup
  - $\langle PU \rangle \approx 50$  events per crossing by LS2
  - $\langle PU \rangle \approx 60$  events per crossing by LS3
  - $\langle PU \rangle \approx 140$  events per crossing by HL-LHC
- Radiation damage
  - Requires work to maintain calibration
  - Limits performance-lifetime of the detectors
    - Light loss (calorimeters)
    - Increased leakage current (silicon detectors)

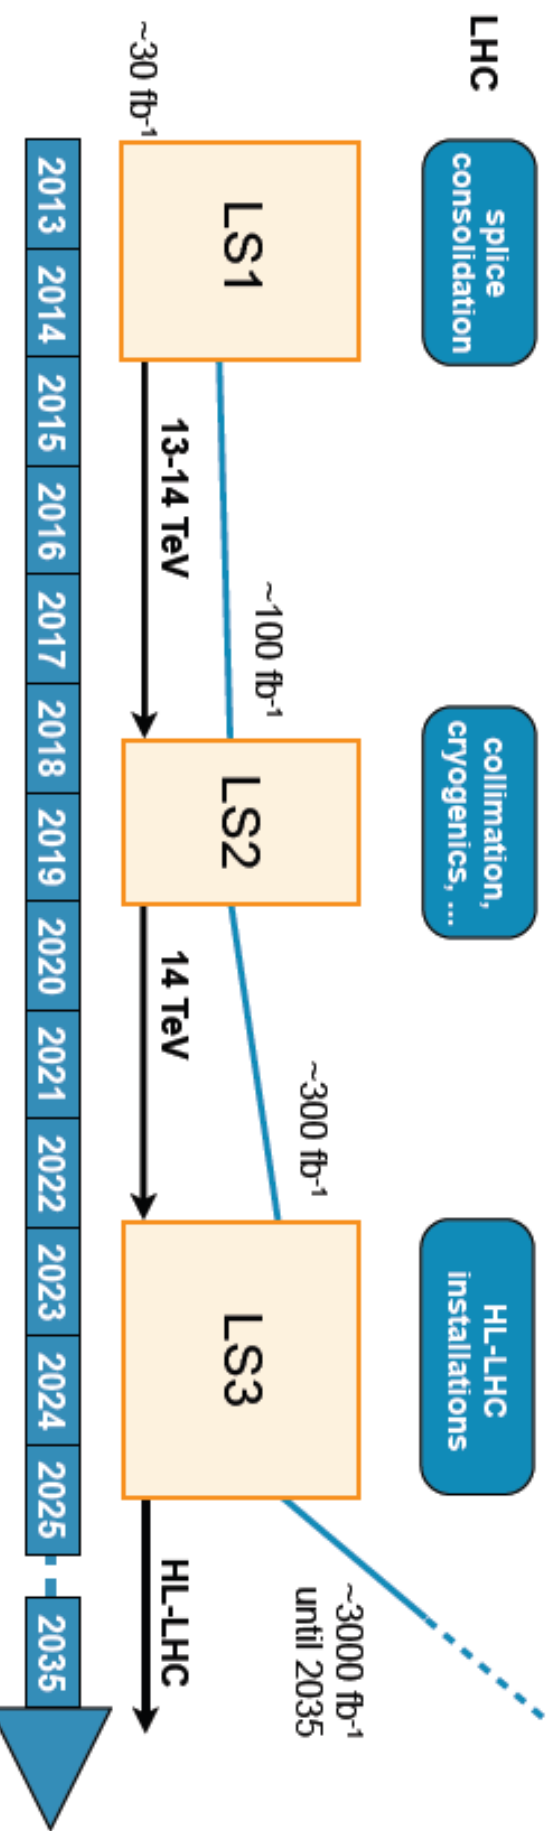

# Try to visualize x5!

# ATLAS Upgrade Roadmap

**A long and exciting road ahead !**

# CMS Phase II Upgrade

## New Tracker

- Radiation tolerant - high granularity - less material
- Tracks in hardware trigger (L1)
- Coverage up to  $\eta \sim 4$

## Barrel ECAL

- Replace FE electronics
- Cool detector/APDs

## Trigger/DAQ

- L1 (hardware) with tracks and rate up  $\sim 750$  kHz
- L1 latency  $12.5 \mu\text{s}$
- HLT output rate  $7.5$  kHz

## Other R&D

- Fast-timing for in-time pileup suppression
- Pixel trigger

## Muons

- Replace DT FE electronics
- Complete RPC coverage in forward region (new GEM/RPC technology)
- Investigate Muon-tagging up to  $\eta \sim 3$

## New Endcap

### Calorimeters

- Radiation tolerant
- High granularity

# LHCb Upgrade

All subdetectors are read out at 40 MHz

RICH 1 redesigned; new photodetectors for RICH 1 and RICH 2

Scifi

Magnet

5m

y

RICH1

PIXEL  
VELO

UT

Replacement of full tracking system

RICH2

ECAL

HCAL

M2

M3

M4

M5

5m

Calorimetry and muons:

- Redundant components of system removed; new electronics added; more shielding included

# ALICE Upgrade

## New Inner Tracking System (ITS)

- improved pointing precision
- less material -> thinnest tracker at the LHC

## Time Projection Chamber (TPC)

- New Micropattern gas detector technology
- continuous readout

## New Central Trigger Processor (CTP)

## Data Acquisition (DAQ)/ High Level Trigger (HLT)

- new architecture
- on line tracking & data compression
- 50KHz PbP event rate

## Muon Forward Tracker (MFT)

- new Si tracker
- Improved MUON pointing precision

## MUON ARM

- continuous readout electronics

## TOF, TRD

- Faster readout

## New Trigger Detectors (FIT)

(c) by St. Rossegger

# FCC: physics reach in a nutshell

## FCC-hh: 100 TeV

- ❑ explore directly the 10-50 TeV E-scale
- ❑ provide conclusive exploration of EWSB dynamics
- ❑ study nature the Higgs potential and EW phase transition
- ❑ say final word about heavy WIMP dark matter
- ❑ etc.

## FCC-ee: 90-350 GeV

- ❑ indirect sensitivity to E scales up to  $O(100 \text{ TeV})$  by measuring most Higgs couplings to  $O(0.1\%)$ , improving the precision of EW parameters measurements by  $\sim 20\text{-}200$ ,  $\Delta M_W < 1 \text{ MeV}$ ,  $\Delta m_{\text{top}} \sim 10 \text{ MeV}$ , etc.
- ❑ sensitivity to very-weakly coupled physics (e.g. light, weakly-coupled dark matter)
- ❑ etc.

## FCC-ep: $\sim 3.5 \text{ TeV}$

- ❑ unprecedented measurements of PDF and  $\alpha_s$
- ❑ new physics: leptoquarks, eeqq contact interactions, etc.
- ❑ Higgs couplings (e.g.  $Hbb$  to  $\sim 1\%$ )
- ❑ etc.

Machines are complementary and synergetic, e.g. from measurement of  $t\bar{t}H/t\bar{t}Z$  ratio, and using  $t\bar{t}Z$  coupling and H branching ratio from FCC-ee, FCC-hh can measure  $t\bar{t}H$  to  $\sim 1\%$

# The challenge is not only the machine...

## Detectors R&D :

- Ultra-light, ultra-fast, ultra-granular, rad-hard, low-power Si trackers
- $10^8$  channel imaging calorimeters (power consumption and cooling at high-rate machines,...)
- big-volume 5-6 T magnets ( $\sim 2 \times$  magnetic length and bore of ATLAS and CMS,  $\sim 50$  GJ stored energy) to reach momentum resolutions of  $\sim 10\%$  for  $p \sim 20$  TeV muons

## Theory:

- improved theoretical calculations (higher-order EW and QCD corrections) needed to match present and future experimental precision on EW observables, Higgs mass and branching ratios.
- Work together with experiments on model-independent analyses in the framework of Effective Field Theory

# Higher $\sqrt{s}$ in the LHC tunnel ?

Fabiola Gianotti,  
FCC Week 2016

Various options,  
with increasing  
amount of HW  
changes, technical  
challenges, cost,  
and physics reach

- WG set up to explore technical feasibility of pushing LHC energy to:
- 1) design value: 14 TeV
  - 2) ultimate value: 15 TeV (corresponding to max dipole field of 9 T)
  - 3) beyond (e.g. by replacing 1/3 of dipoles with 11 T Nb<sub>3</sub>Sn magnets)
- Identify open risks, needed tests and technical developments, trade-off between energy and machine efficiency/availability
- Report on 1) end 2016, 2) end 2017, 3) end 2018 (in time for ES)

**HE-LHC** (part of FCC study): ~16 T magnets in LHC tunnel (→  $\sqrt{s}$  ~ 30 TeV)

- ❑ uses existing tunnel and infrastructure; can be built at fixed budget
- ❑ strong physics case if new physics from LHC/HL-LHC
- ❑ powerful demonstration of the FCC-hh magnet technology

# LHeC, not only PDFs

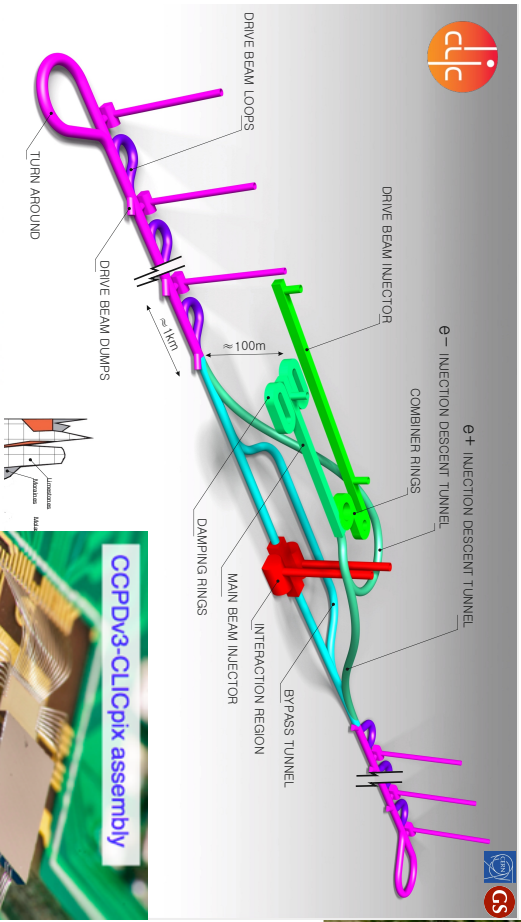

Continuing activity on  
Physics  
Detector  
ERL

Goal:  $L \sim 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$

# The CLIC project

# International Linear Collider (ILC)

Total length: 31 km

Technical Design  
Report released  
in June 2013

## Main challenges:

- ❑ ~ 15000 SCRF cavities (1700 cryomodules), 31.5 MV/m gradient
- ❑ 1 TeV machine requires extension of main Linacs (50 km) and 45 MV/m
- ❑ Positron source; suppression of electron-cloud in positron damping ring
- ❑ Final focus: squeeze and collide nm-size beams

$\sqrt{s}$ =250 (initial), 500 (design), 1000 (upgrade) GeV  
 $L \sim 0.75\text{-}5 \times 10^{34}$   
(running at  $\sqrt{s}$ =90, 160, 350 GeV also envisaged)

- ❑ Japan interested to host → decision ~2018 based also on ongoing international discussions

Mature technology: 20 years of R&D experience worldwide  
(e.g. European xFEL at DESY is 5% of ILC, gradient 24 MV/m, some cavities achieved 29.6 MV/m)

- Construction could technically start ~2019, duration ~10 years → physics could start ~2030

# Disruptive Technologies: Wakefield Acceleration

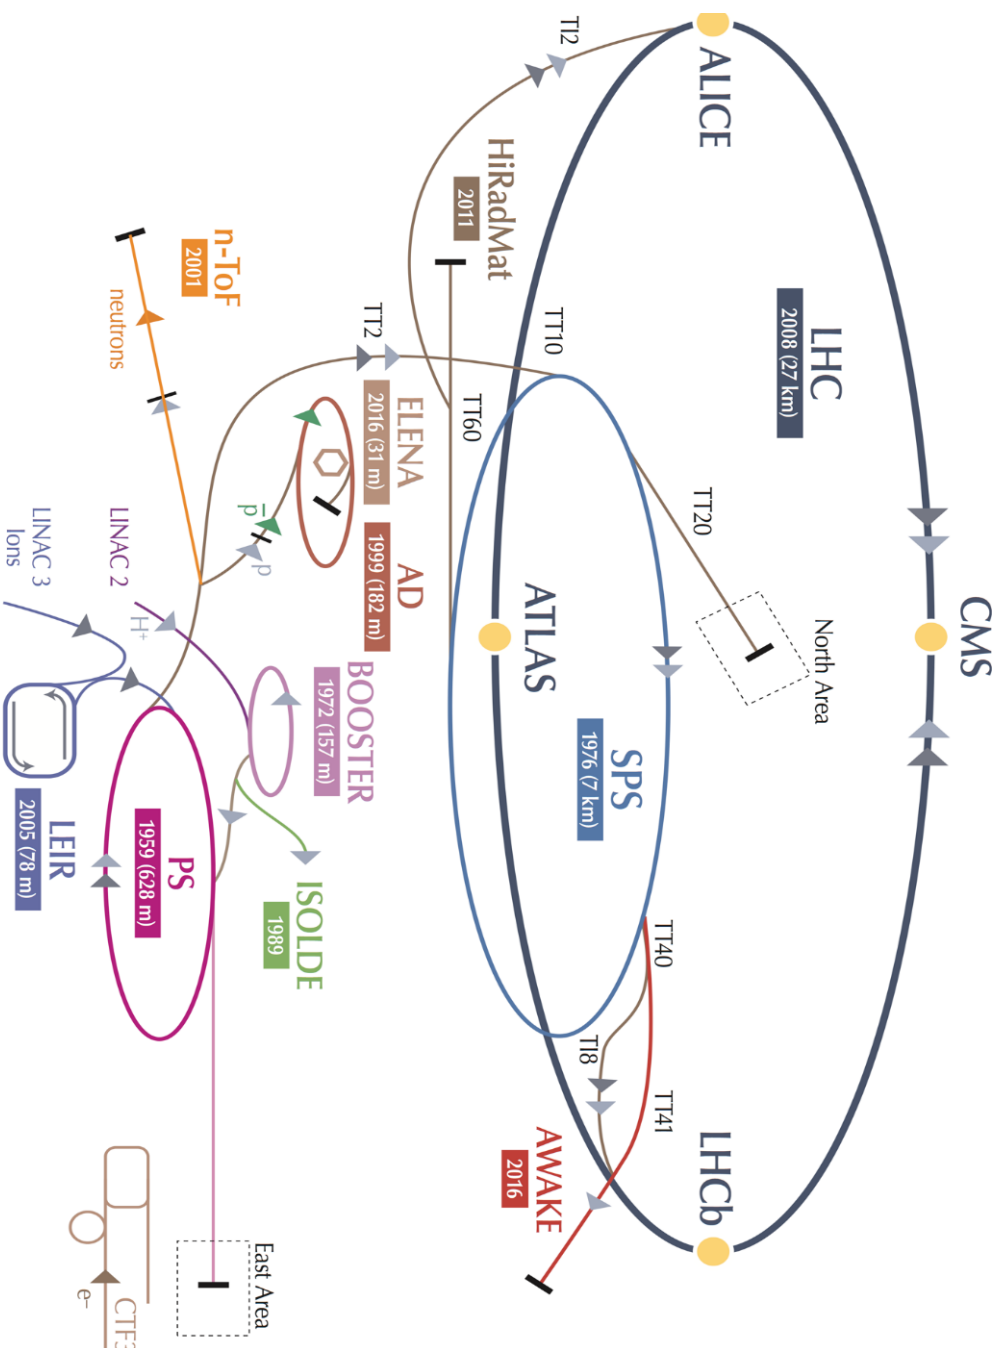

## Experimental Layout

# A compelling programme beyond the LHC

~20 experiments > 1200 physicists

**AD:** Antiproton Decelerator for antimatter studies

**CAST, OSQAR:** axions

**CLOUD:** impact of cosmic rays on aerosols and clouds → implications on climate

**COMPASS:** hadron structure and spectroscopy

**ISOLDE:** radioactive nuclei facility

**NA61/Shine:** ions and neutrino targets

**NA62:** rare kaon decays

**NA63:** radiation processes in strong EM fields

**n-TOF:** n-induced cross-sections

**UA9:** crystal collimation

**Neutrino Platform:** collaborating with experiments in US and Japan → see later

Neutrino oscillations (e.g.  $\nu_\mu \rightarrow \nu_e$ ) established (since 1998) with solar, atmospheric, reactor and accelerator neutrinos  $\rightarrow$  imply neutrinos have masses and mix

Since then: great progress in understanding  $\nu$  properties at various facilities all over the world

Nevertheless, several open questions:

- ☐ Origin of  $\nu$  masses (e.g. why so light compared to other fermions ?)
- ☐ Mass hierarchy: normal ( $\nu_3$  is heaviest) or inverted ( $\nu_3$  is lightest) ?
- ☐ Why mixing much larger than for quarks ?
- ☐ CP violation (observed in quark sector): do  $\nu$  and anti- $\nu$  behave in the same way?
- ☐ Are there additional (sterile)  $\nu$  (hints from observed anomalies)?

Accelerator experiments can address some of above questions studying  $\nu_\mu \rightarrow \nu_e$  oscillations  
Need high-intensity  $p$  sources ( $> 1\text{MW}$ ) and massive detectors, as  $\nu$  are elusive particles  
and the searched-for effects tiny  $\rightarrow$  Next-generation facilities planned in US and Japan.

1) Rapid progress in neutrino oscillation physics, with significant European involvement, has established a strong scientific case for a long-baseline neutrino programme exploring CP violation and the mass hierarchy in the neutrino sector. CERN should develop a neutrino programme to pave the way for a substantial European role in future long-baseline experiments. Europe should explore the possibility of major participation in leading long-baseline neutrino projects in the US and Japan.

# Long Baseline Neutrino Facility (LBNF) at FNAL

1.2 MW p beam, 60-120 GeV (PIP-II)  
Wide-band  $\nu$  beam 0.5-2.5 GeV

**Fermilab**

DUNE experiment:  
4x10 kt LAr detectors  
~1.5 km underground

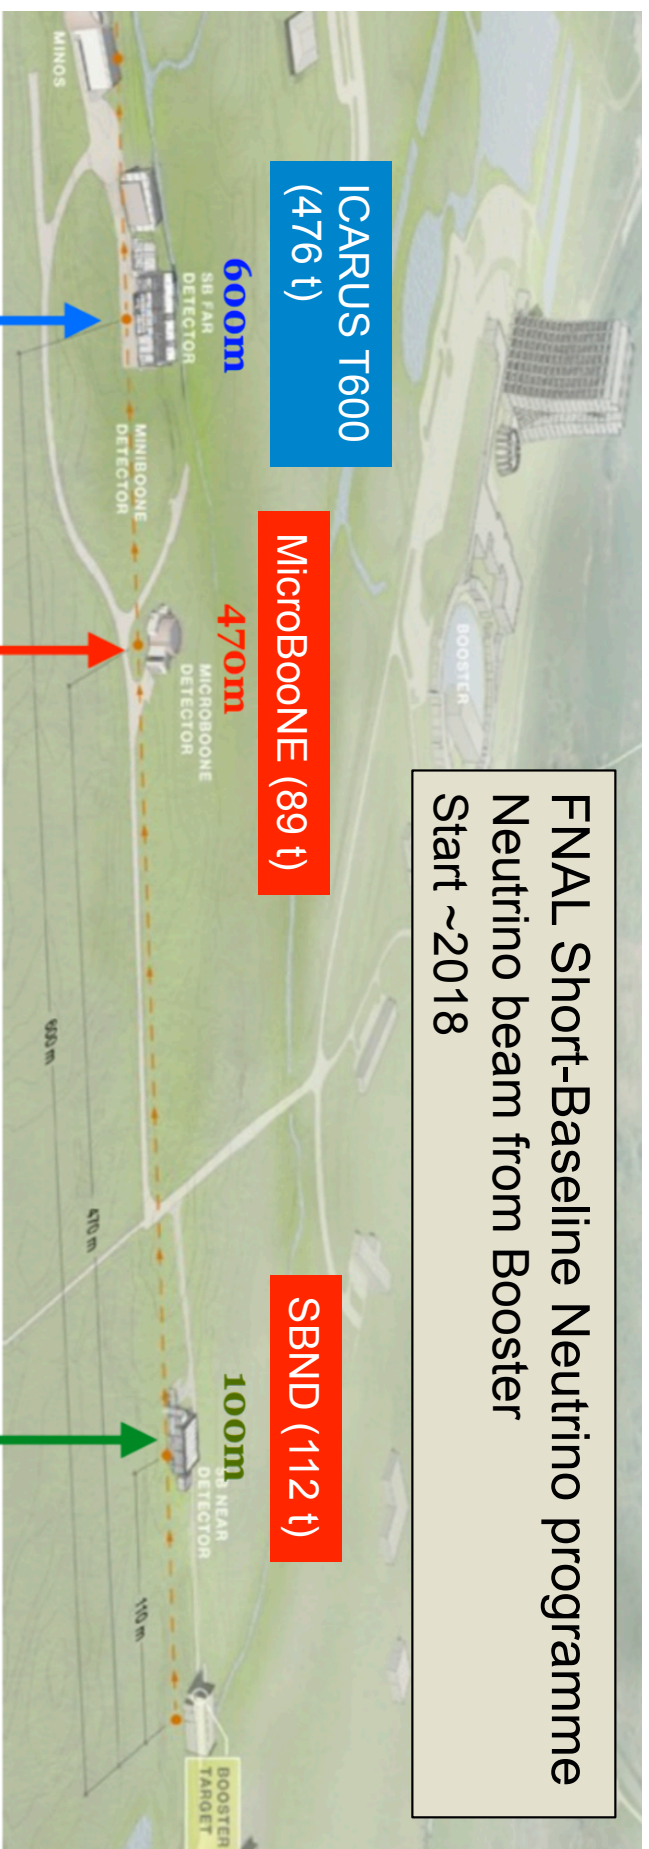

Far site construction starts ~2017, 1<sup>st</sup> detector installed ~2022, beam from FNAL ~ 2026

FNAL Short-Baseline Neutrino programme  
Neutrino beam from Booster  
Start ~2018

ICARUS T600  
(476 t)

MicroBooNE (89 t)

SBND (112 t)

# A 25+ years Physics Program

---

On the beam:

- Perform a comprehensive investigation of neutrino oscillations to:
  - test CP violation in the lepton sector
  - determine the ordering of the neutrino masses
  - test the three-neutrino paradigm
- Perform a broad set of neutrino scattering measurements with the near detector

Exploit the large, high-resolution, underground far detector for non-accelerator physics topics:

- atmospheric neutrino measurements
  - searches for nucleon decay
  - measurement of astrophysical neutrinos (especially those from a core-collapse supernova).
-

# Hyper-Kamiokande, JPARC: construction could start ~2018

0.38 → 0.75 → > 1 MW p source  
 $E_p = 30 \text{ GeV} \rightarrow E_\nu \sim 0.6 \text{ GeV}$   
 Narrow-band  $\nu$  beam  
 → high intensity at oscillation peak

~0.5 Mton Water Cerenkov detector  
 (~20 x Super-K)  
 ~ 1 km underground  
 ~ 2.5° off-axis → narrow-band beam

Complementary to LBNE: different detector technology, shorter baseline (→ less sensitive to mass hierarchy), narrow-band beam (→ high statistics of  $\nu/\text{anti-}\nu$  at oscillation peak but limited measurement of oscillation spectrum)

ready for beam tests in 2018 (before LS2)

## Mission:

- ❑ Provide charged beams and test space to neutrino community → North Area extension
- ❑ Support European participation in accelerator neutrino experiments in US and Japan:
  - R&D to demonstrate large-scale LAr technology (cryostats, cryogenics, detectors)
  - Construction of one cryostat for DUNE detector modules
  - Construction of BabyMIND magnet: muon spectrometer for WAGASCI experiment at JPARC

Refurbishment of ICARUS T600 for short baseline programme  
→ ship to FNAL beg 2017

Construction and test of “full-scale” prototypes of DUNE drift cells:  $\sim 6 \times 6 \times 6 \text{ m}^3$ ,  $\sim 700 \text{ tons}$

“Natural” continuation of LHC and HL-LHC programmes.

Step-wise approach → each step deployed and operated in a (big) accelerator:

- ❑ LHC: 8.3 T → push to ultimate field of 9 T ?
- ❑ HL-LHC: Nb<sub>3</sub>Sn technology:
  - 11 T dipoles in dispersion suppression collimators
  - 12-13 T peak field low- $\beta$  quads for ATLAS and CMS IR's

December 2015: short (1.8 m)  
Nb<sub>3</sub>Sn two-in-one dipole reached  
11.3 T (> nominal) without quenches

March 2016: short (1.5 m) Nb<sub>3</sub>Sn quadrupole model (final aperture = 150 mm) reached current 18 kA (nominal: 16.5 kA). CERN-US LARP Collaboration (2 coils from CERN + 2 coils from US)

# Future opportunities other than high-energy colliders

A “Physics Beyond Colliders” Study Group has been put in place

## Mandate

Explore opportunities offered by CERN accelerator complex and infrastructure to address outstanding questions in particle physics through projects:

- ☐ complementary to future high-energy colliders (HE-LHC, CLIC, FCC)
  - ☐ exploiting unique capabilities of CERN accelerator complex and infrastructure
  - ☐ complementary to other efforts in the world → optimise resources of the discipline globally
- Examples: searches for rare processes and very-weakly interacting particles, electric dipole moments, etc.

→ Enrich and diversify CERN’s future scientific programme

- ☐ Will bring together accelerator scientists, experimental and theoretical physicists
- ☐ Kick-off meeting in Summer 2016
- ☐ Final report end 2018 → in time for European Strategy

One of the goals is to involve interested worldwide community, and to create synergies with other laboratories and institutions in Europe (and beyond)

# In summary

An exciting period in front of us:

- We have finished the inventory of the “known unknown” ...
- ...but we have a vast space to explore (and a few tantalizing hints to probe)
- We have a solid physics program for the next 15 – 20 years
- In this time period we have to prepare for the next steps, setting directions, technologies and political frames.

# In summary

---

**Experimental results** will be dictating the agenda of the field.

We will need:

- **Flexibility**
- **Preparedness**
- **Visionary global policies**

---

THANK YOU

---
