OSIRIS 2.0

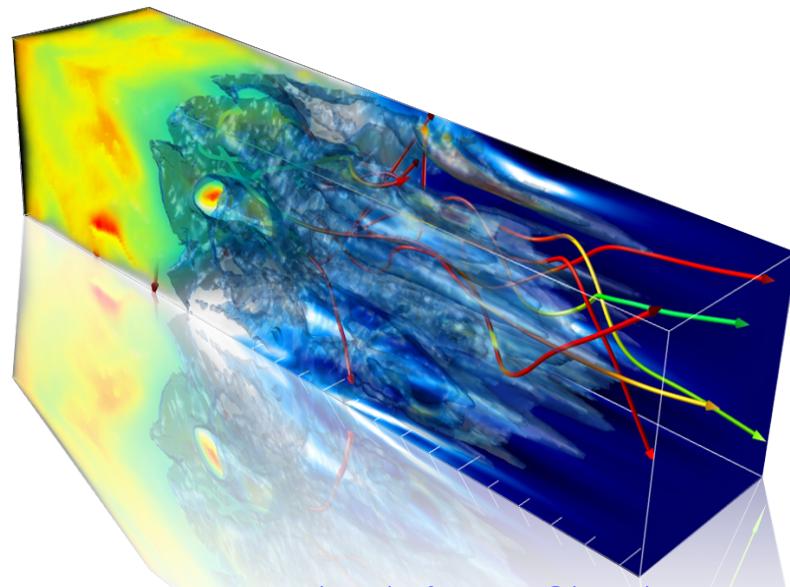

osiris
v2.0

osiris framework

- Massively Parallel, Fully Relativistic Particle-in-Cell (PIC) Code
- New Hybrid algorithm
- Visualization and Data Analysis Infrastructure
- Developed by the osiris.consortium
⇒ UCLA + IST

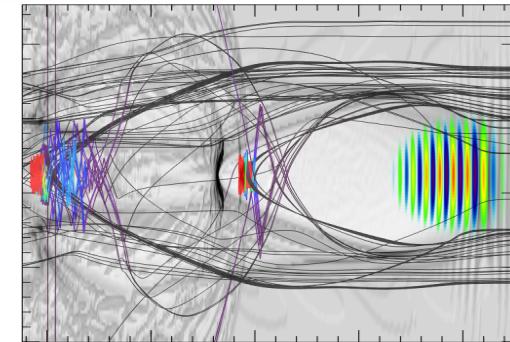

Ricardo Fonseca: ricardo.fonseca@ist.utl.pt

Frank Tsung: tsung@physics.ucla.edu

<http://cfp.ist.utl.pt/golp/epp/>

<http://plasmasim.physics.ucla.edu/>

New Features in v2.0

- High-order splines
- Binary Collision Module
- Hybrid code
- Boosted frame
- PML absorbing BC
- Vector processor optimization (SSE)
- Energy and momentum conserving field interpolation
- Higher order and dispersion free solvers
- OpenMP/MPI hybrid
- 3D Dynamic Load Balancing
- Parallel I/O

SELF-MODULATION INSTABILITY (SMI)

MAX-PLANCK-GESSELLSCHAFT

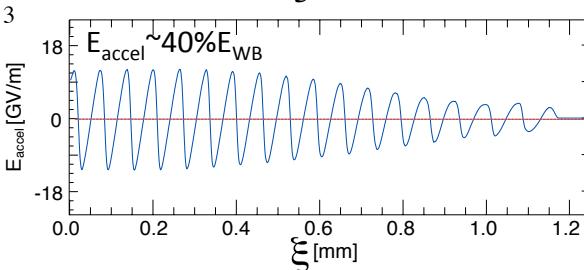

Kumar, PRL 104, 255003 (2010)

$$N_{\text{exp}} \approx \frac{3\sqrt{3}}{4} \left(\frac{n_b}{n_e} \frac{m_e}{\gamma M_b} (k_p |\xi|) (k_p z)^2 \right)^{1/3}$$

Grows along the bunch & along the plasma
Convective instability

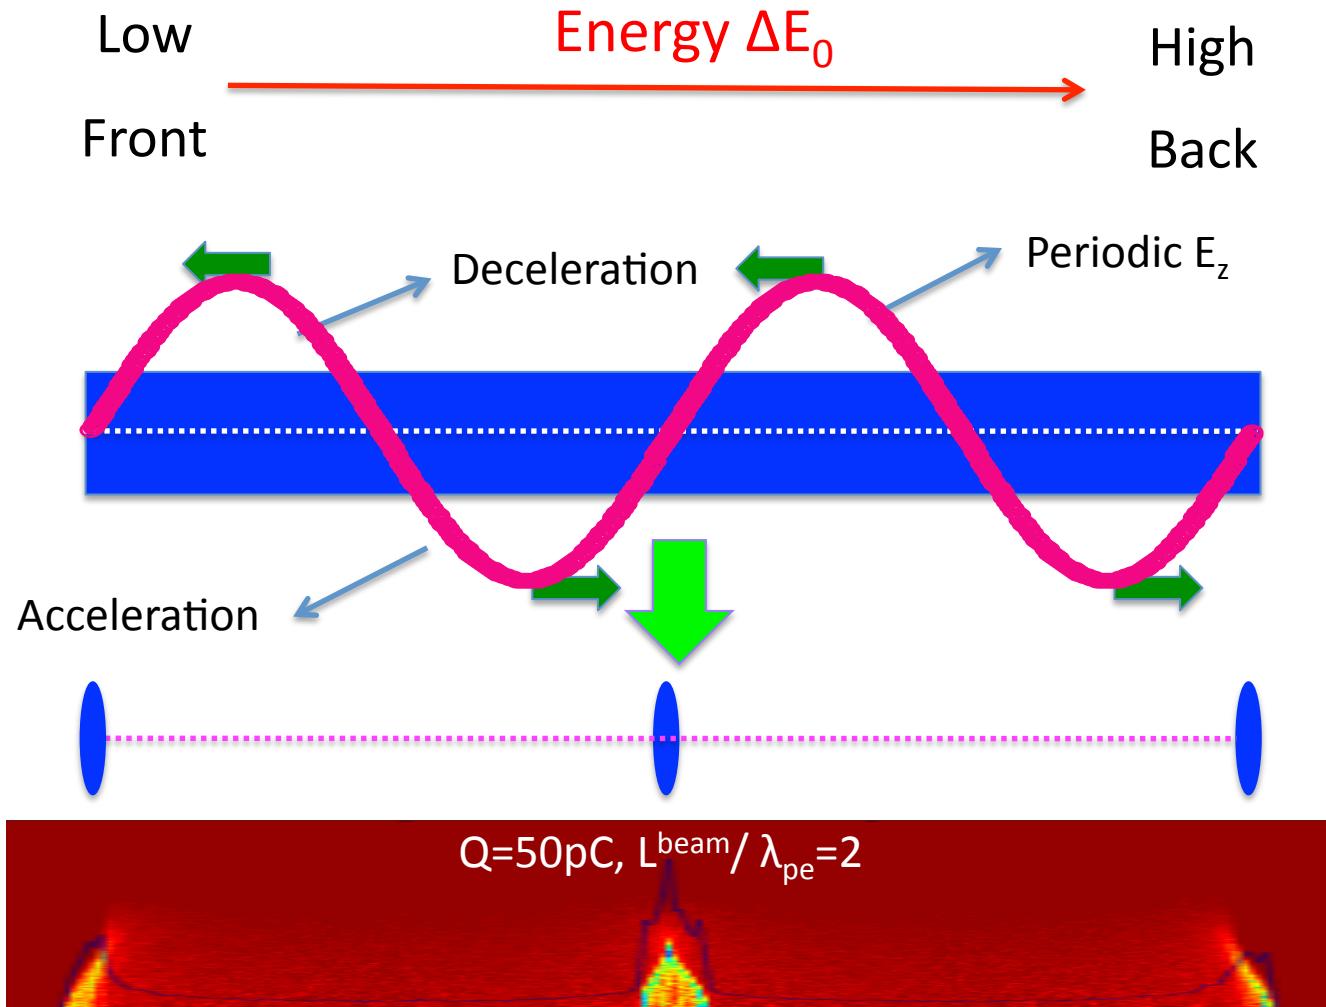

Pukhov, PRL 107, 145003 (2011)
Schroeder, PRL 107, 145002 (2011)

- ❖ Initial small **transverse** wakefields **modulate** the bunch density
- ❖ Seeding of SMI important to **shorten length to saturation** and for wakefield phase for **deterministic external injection**
- ❖ **Longitudinal** wakefields can lead to **energy** (not spatial) **modulation**

ENERGY SELF-MODULATION

MAX-PLANCK-GESELLSCHAFT

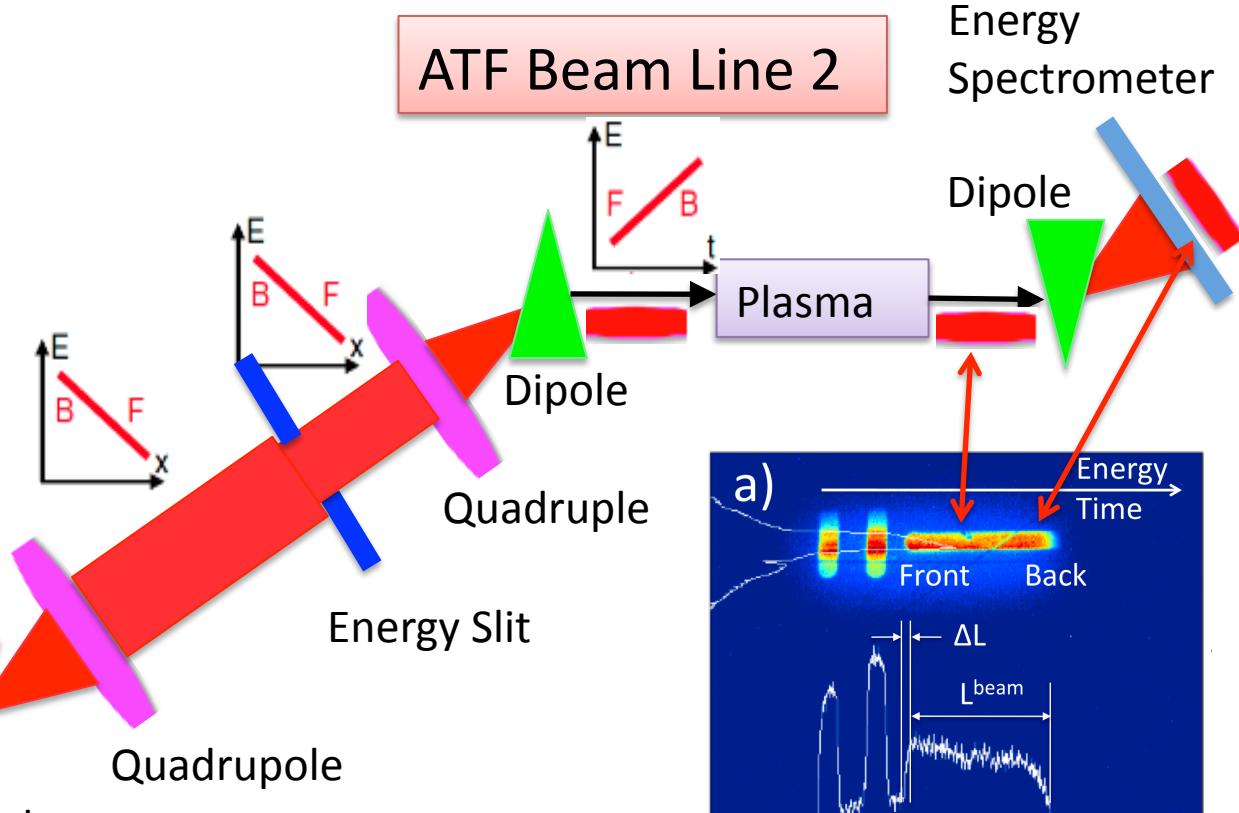

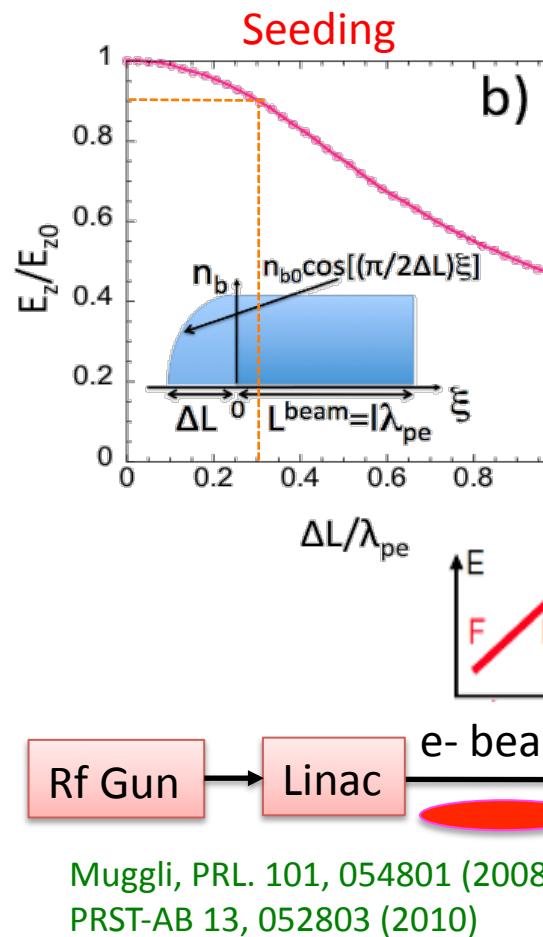

- ❖ Similar to FEL energy modulation
- ❖ Indirect evidence ($W_{//}=E_z$) of driving of wakefields that can seed the SMI: $W_{\text{perp}}=(E_r-cB_\theta)\alpha W_{//}$

Energy Gain/Loss:			
$\Delta E = \frac{1}{4} \cdot \frac{\Delta E_0}{m}$			$m = L^{\text{beam}} / \lambda_{pe} = 1, 2, \dots$
$E_z = \frac{1}{4} \cdot \frac{\Delta E_0}{m \cdot eL^{\text{plasma}}}$			
E _z must decreases from ~6 to ~1.2MV/m to preserve visibility!			
Choose Q=50pC			
Linear PWFA theory:			
$E_z(r=0) = \frac{-mQ}{\epsilon_0 L_b^2 \sigma_r^2} \int_0^\infty e^{-r^2/2\sigma_r^2} K_0(2\pi m r/L_b) r dr$			
m	$E_{z, \text{opt}}$ (MV/m)	$E_{z, \text{lin, OSIRIS}}$ (MV/m)	$n_e \sim m^2$ (cm ⁻³)
1	5.2	3.7	1.2×10^{15}
2	3.0	3.2	4.8×10^{15}
3	2.0	2.6	1.1×10^{16}
4	1.5	2.1	1.9×10^{16}
5	1.2	1.8	3.0×10^{16}

EXPERIMENTAL SETUP

MAX-PLANCK-GESELLSCHAFT

- ❖ Use masking method to produce “square” bunch for SMI seeding
- ❖ Need cut/step $\ll \lambda_{pe}$: $<0.3\lambda_{pe}$ in exp. $\Rightarrow E_{z0} > 0.9E_{z0}$ sharp

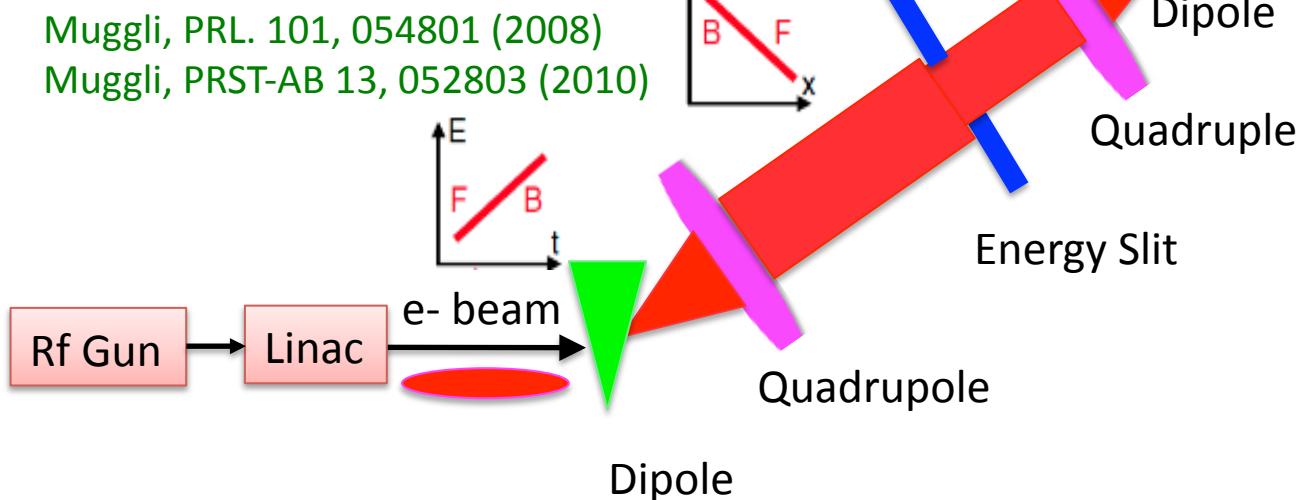

EXPERIMENTAL SETUP

MAX-PLANCK-GESELLSCHAFT

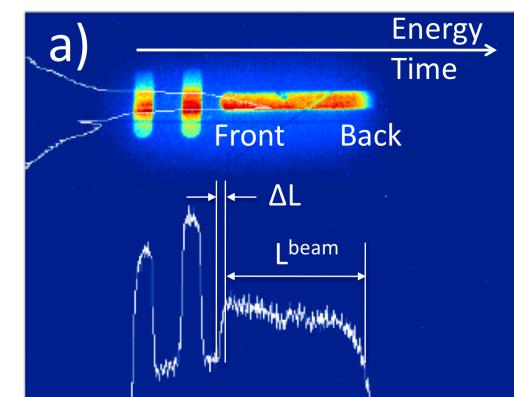

Parameter	Value
Bunch Energy E_0	$\sim 60 \text{ MeV}$
Bunch Charge Q	$50\text{pC} - 1\text{nC}$
Bunch Focused Size σ_{r0}	$\sim 100\mu\text{m}$
Square Bunch Length L_{bunch}	$\sim 960 \mu\text{m}$
Normalized Emittance ϵ_N	$\sim 3 \text{ mm-mrad}$
Plasma Density n_e	$\sim 10^{14} - 10^{18} \text{ cm}^{-3}$
Plasma Length L^{plasma}	$\sim 2 \text{ cm}$
Capillary Radius	$500 \mu\text{m}$

Muggli, PRL. 101, 054801 (2008)
Muggli, PRST-AB 13, 052803 (2010)

ATF Beam Line 2

Energy Spectrometer

- ❖ Use masking method to produce “square” bunch for SMI seeding
- ❖ Need cut/step $\ll \lambda_{pe}$: $<0.3\lambda_{pe}$ in exp. $\Rightarrow E_{z0} > 0.9E_{z0 \text{ sharp}}$

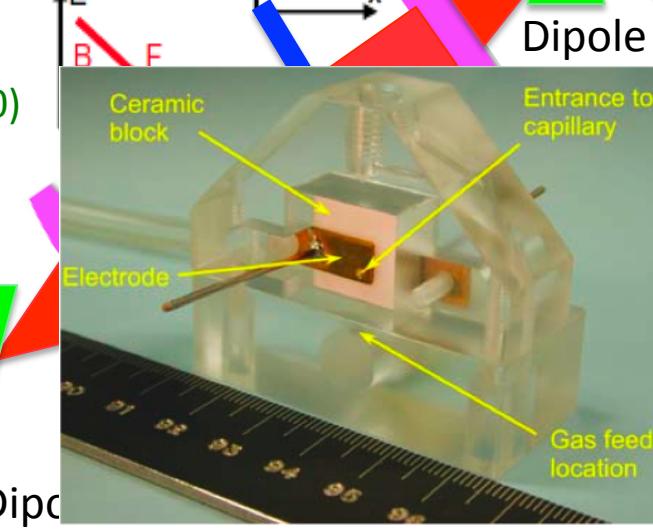

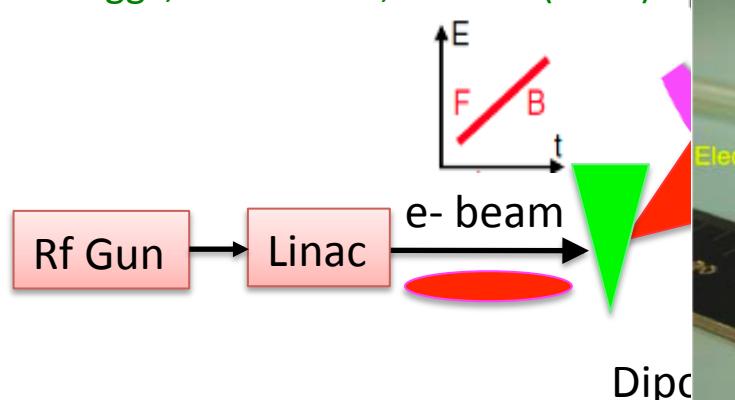

EXPERIMENTAL SETUP

Muggli, PRST-AB 13, 052803 (2010)

Kimura, AAC'06 Proceedings

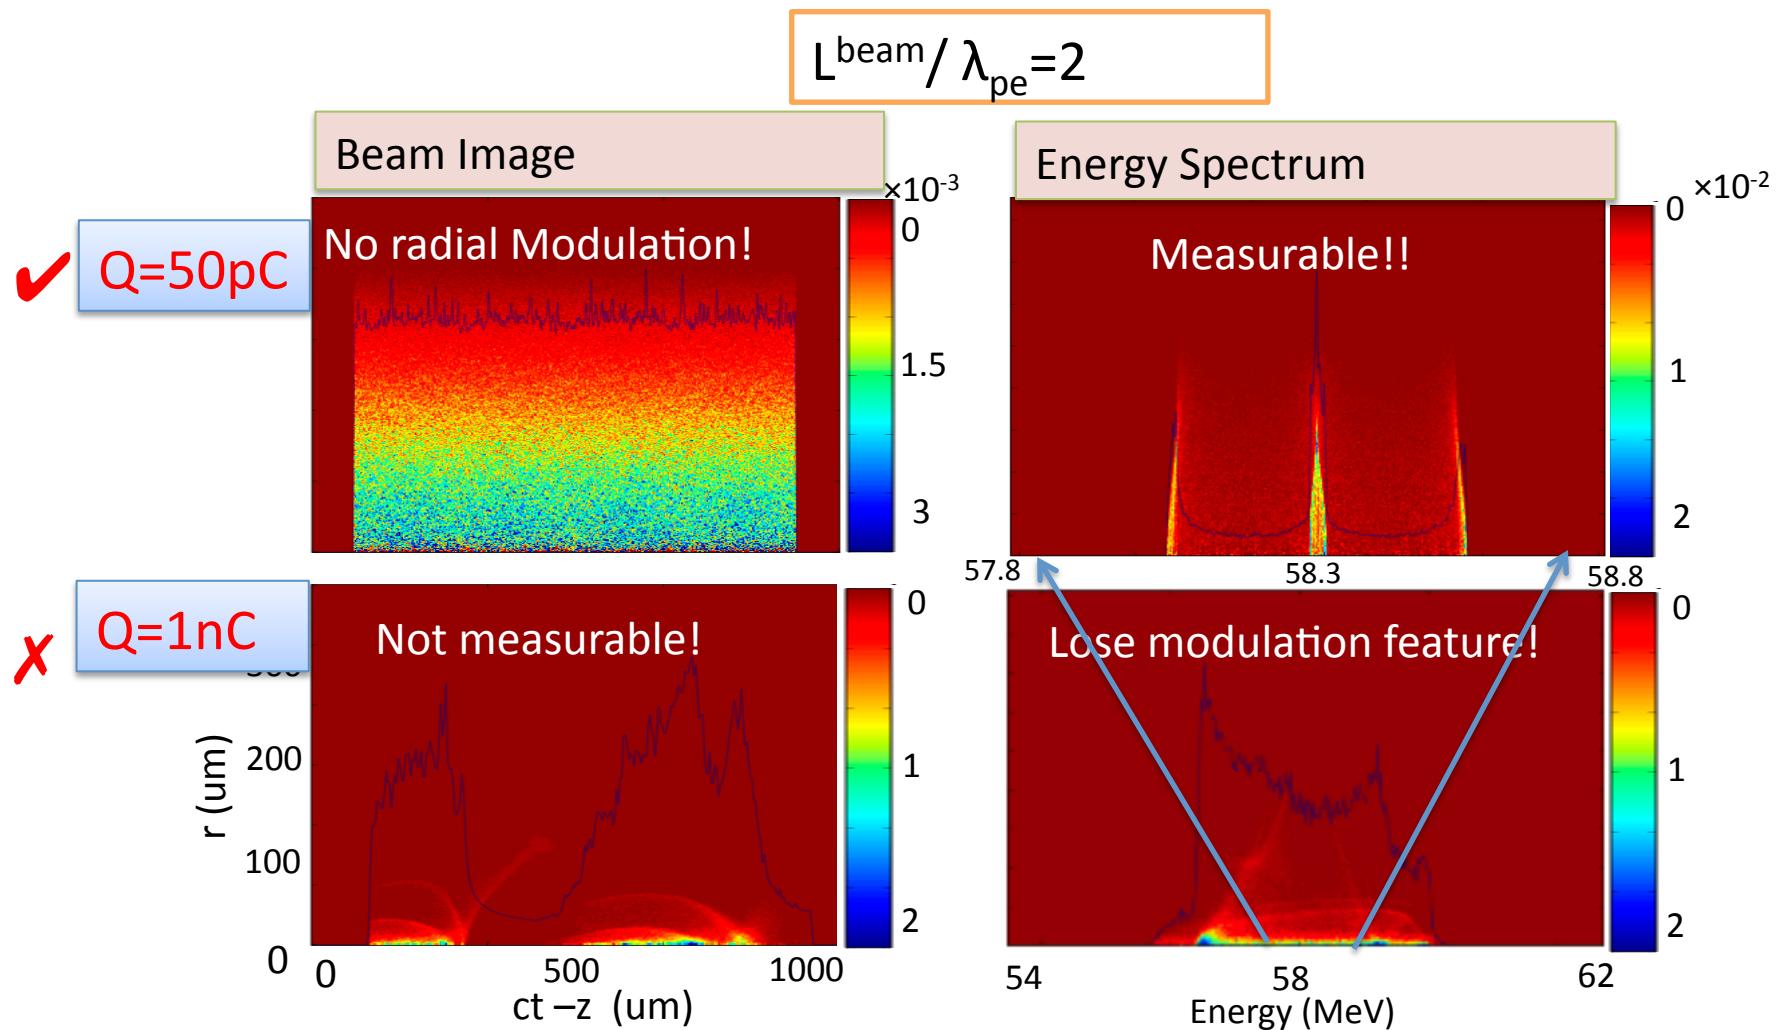

ATF Beam Line 2

Muggli, AAC'10 Proceedings

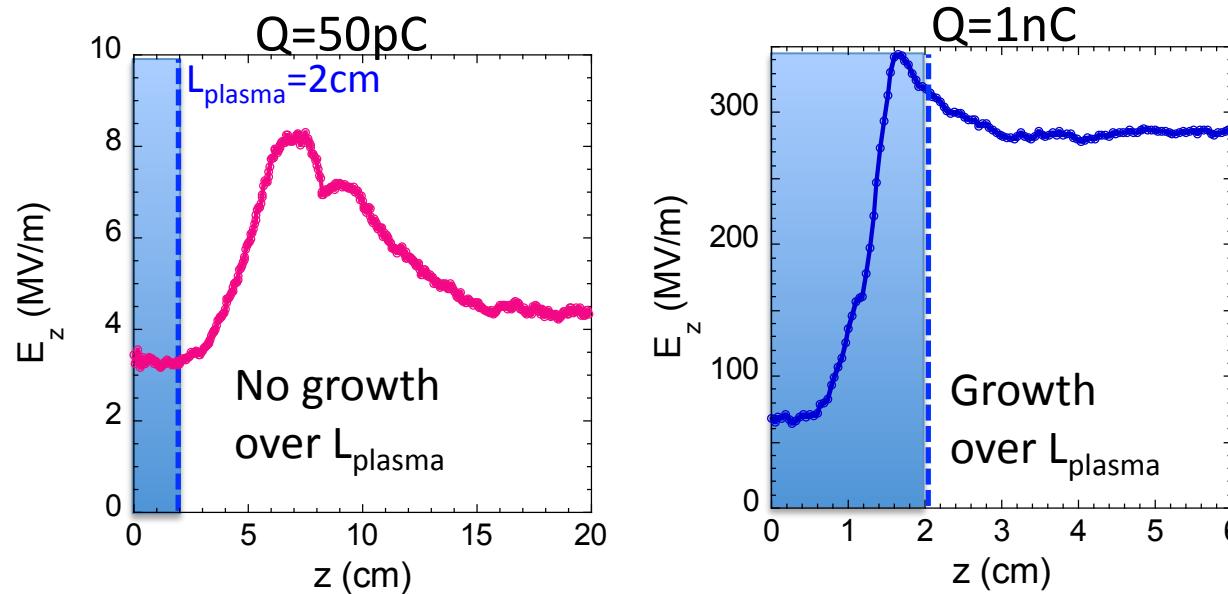

- ❖ Use masking method to produce “square” bunch for SMI seeding
- ❖ Need cut/step $\ll \lambda_{pe}$: $<0.3\lambda_{pe}$ in exp. $\Rightarrow E_{z0} > 0.9E_{z0 \text{ sharp}}$

SMI AT HIGH CHARGE

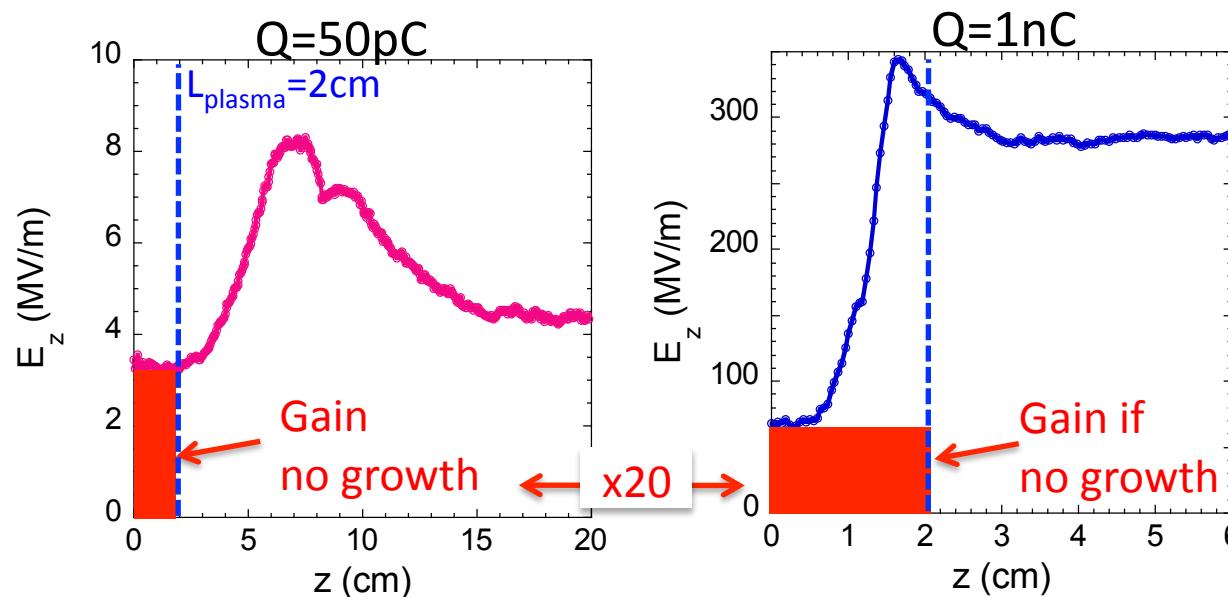

- ❖ Note with 1nC featureless energy spectrum ($\Delta E \gg \Delta E_0$)
- ❖ Growth from energy gain/loss with high charge (1nC)?

❖ Determine occurrence of SMI growth from energy spectrum $\Delta E \gg \Delta E_0$?

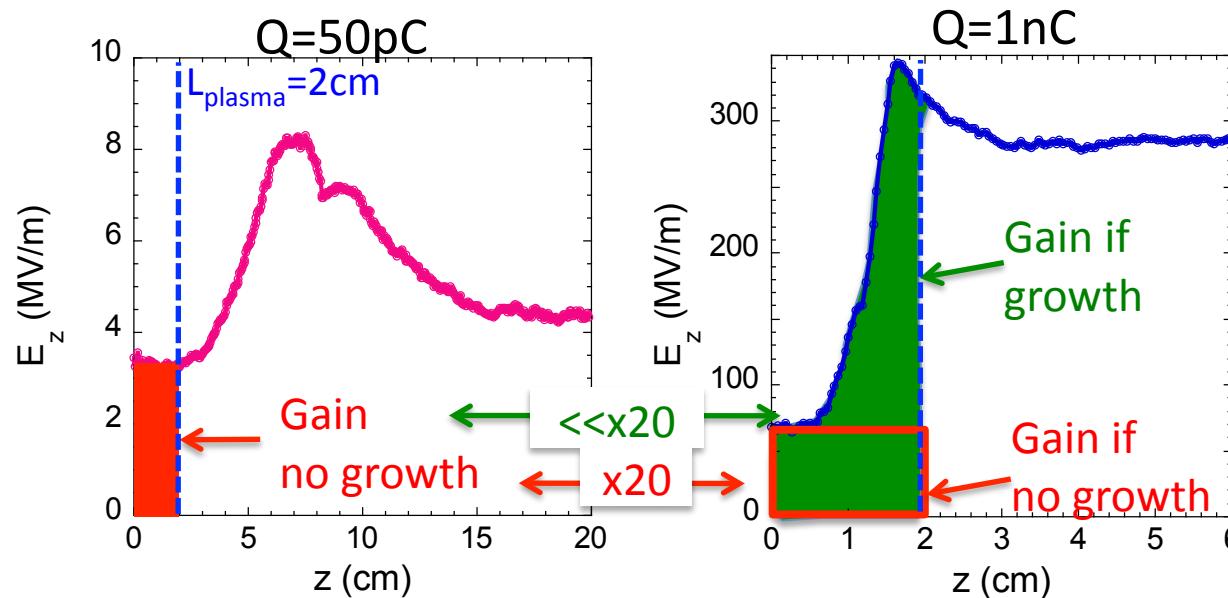

❖ Gain = $\int E_+(z) dz = E_0 L_{\text{plasma}}$ w/wo SMI growth

❖ Determine occurrence of SMI growth from energy spectrum $\Delta E \gg \Delta E_0$?

- ❖ Gain = $\int E_+(z) dz = E_0 L_{\text{plasma}}$ w/wo SMI growth
- ❖ With 50pC $E_0 \approx 3\text{MV/m}$, $L_{\text{plasma}} \approx 2\text{cm} \Rightarrow \text{Gain} \approx 60\text{KeV} < \Delta E_0 \approx 480\text{keV} \Rightarrow$ Modulation
- ❖ With 1nC $E_0 \approx 20 * 3\text{MV/m}$, $L_{\text{plasma}} \approx 2\text{cm} \Rightarrow \text{Gain} \approx 1.2\text{MeV}$ without SMI growth

❖ Determine occurrence of SMI growth from energy spectrum $\Delta E \gg \Delta E_0$?

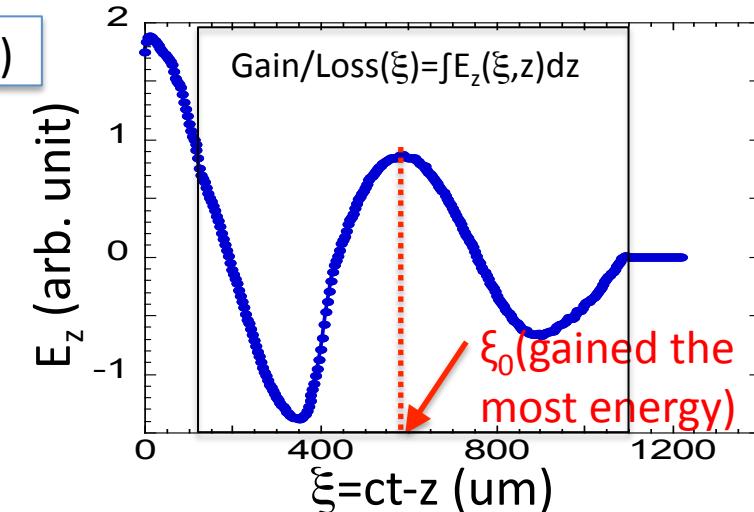

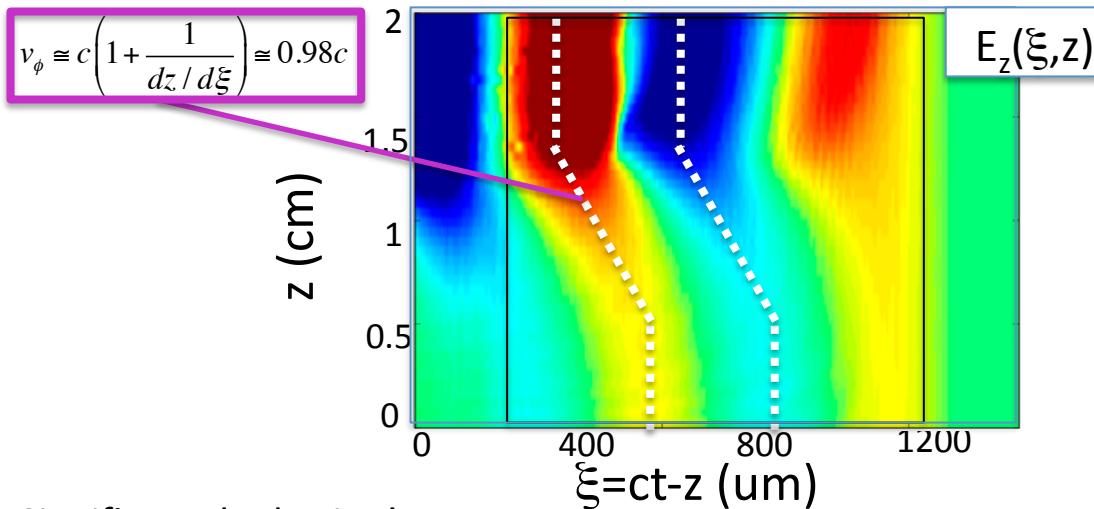

- ❖ Gain = $\int E_+(z) dz = E_0 L_{\text{plasma}}$ w/wo SMI growth
- ❖ With 50pC $E_0 \approx 3\text{MV/m}$, $L_{\text{plasma}} \approx 2\text{cm} \Rightarrow \text{Gain} \approx 60\text{KeV} < \Delta E_0 \approx 480\text{keV} \Rightarrow$ Modulation
- ❖ With 1nC $E_0 \approx 20 * 3\text{MV/m}$, $L_{\text{plasma}} \approx 2\text{cm} \Rightarrow \text{Gain} \approx 1.2\text{MeV}$ without SMI growth
- ❖ With SMI growth $\int E_+(z) dz > E_0 L_{\text{plasma}}$ (Gain ≈ 2.6 Gain)

WAKE PHASE VELOCITY

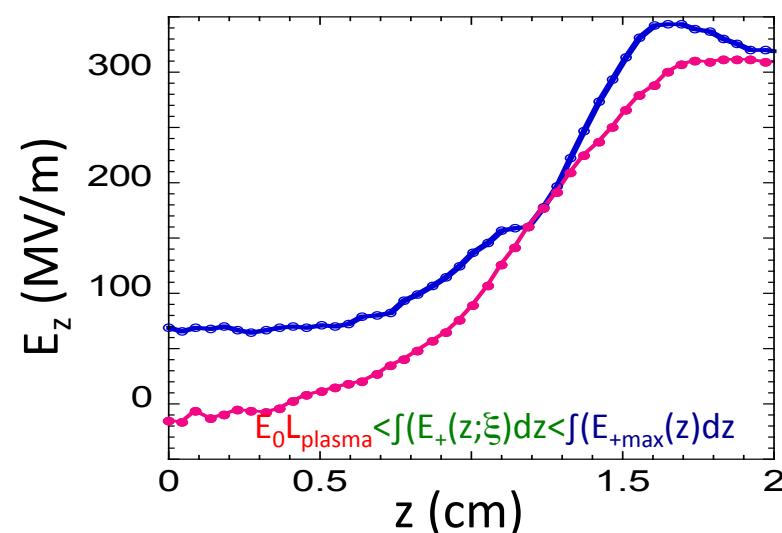

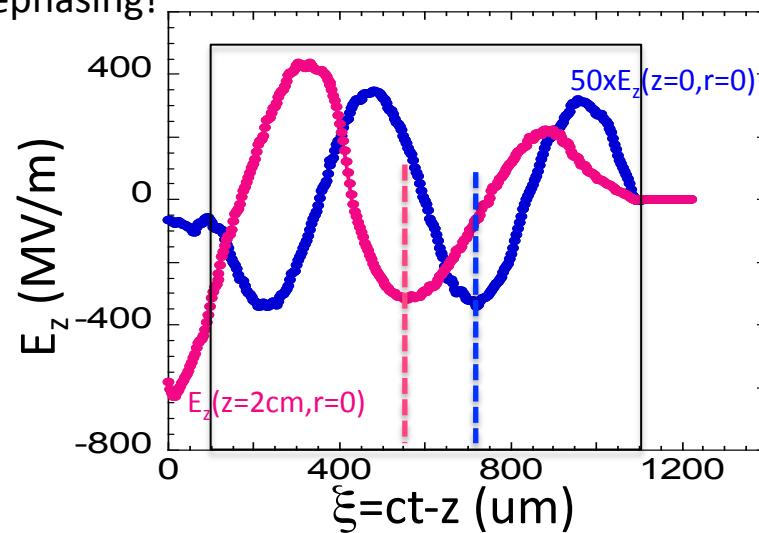

MAX-PLANCK-GESELLSCHAFT

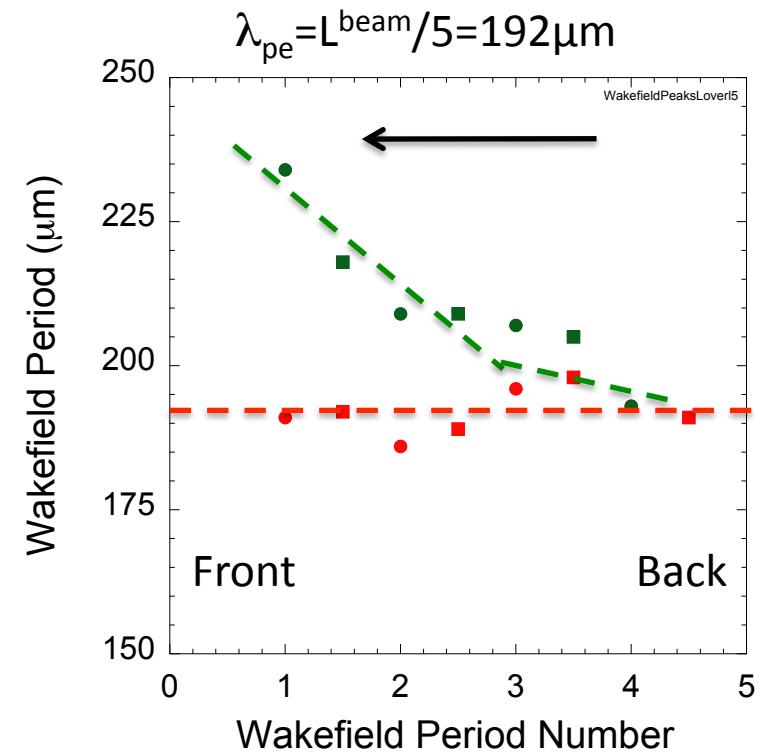

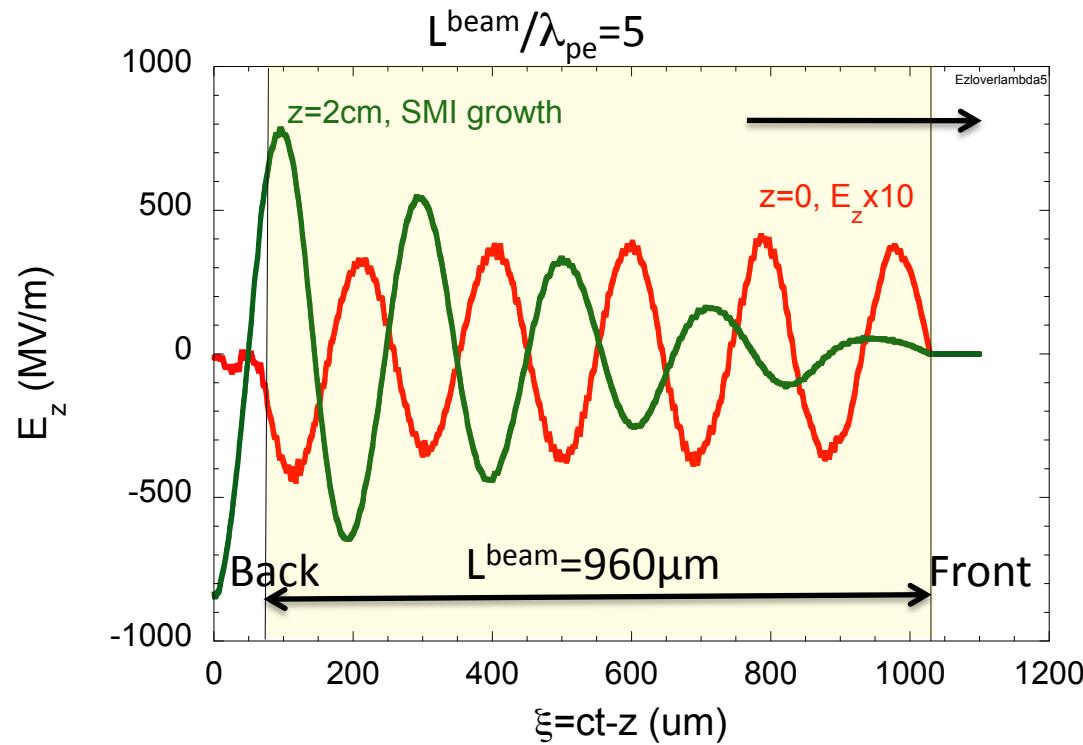

❖ Phase velocity $v_\phi < c$ during SMI growth

Significant dephasing!

- ❖ At 1nC $E_0 \approx 20 * 3 \text{ MV/m}$, $L_{\text{plasma}} \approx 2 \text{ cm} \Rightarrow \text{Gain} \approx 1.2 \text{ MeV}$ without SMI growth
- ❖ With SMI growth $\int (E_+(z)) dz \gg E_0 L_{\text{plasma}}$ (Gain ≈ 2.6 Gain)

- ❖ At saturation the wakefield period is much longer in the bunch front
- ❖ The evolution in the front of the bunch causes the slow wakefields phase velocity ...

- ❖ Shaped, square with $L^{\text{beam}} > \lambda_{\text{pe}}$ bunches drive linear wakefields with period λ_{pe}
- ❖ Wakefield period observed in energy modulation along chirped bunch with $Q=50\text{pC}$
- ❖ If E_z, W_{\parallel} , then $W_{\text{per}} = E_r - cB_\theta \Rightarrow$ seed for SMI
- ❖ Looking for evidence of SMI growth from energy spectra in 1nC bunches

THANK YOU!
