

Dear Pasquale,

ok, I will ask in our next beamtime meeting for 4-5 days  
test beamtime in Oktober (typically Wednesday morning - Monday morning).

What photon energy range do you want to cover?

Typically we run for this tests with an electron energy of 855 MeV and get tagged Bremsstrahlung-photons in the range 5-95% of this energy.

You will have some days time before to set up your things in our hall.

Some other informations:

The beam height is 176 cm, please bring a support with you.

If you need a XY-moving device for your detectors, you will have to bring it also.

Please prepare a stand-alone readout system for your detectors.

We can give you around 10 signals from our tagger to provide the photon energies. You will have to make a coincidence with this tagger-energy-signals.
